## The Next Two Days

- Day 1
  - Morning
    - Layer 2 Network Architecture
    - Layer 3 Network Architecture
  - Afternoon
    - Layer 0 Structured Cabling Systems
    - Network Management Overview
- Day 2
  - Morning
    - Wireless LAN Strawman Proposal
    - Help Desk and Trouble Ticketing
  - Afternoon
    - Open Engineering Discussions

## Why is This Stuff Important

- Need a plan
  - The campus network is foundation that you build RENs on.
  - How else will you know where to make investments?
  - Must have a plan to get Public IP address space

## Campus Networking Best Practices

Session 1: Layer 2

Dale Smith
University of Oregon & NSRC
dsmith@uoregon.edu

## Campus Network Rules

- Build Separate Core and Edge Networks
- Minimize number of network devices in any path
- Use standard solutions for common situations
- Provide services near the core
- Separate border routers from core
- Provide opportunities to firewall and shape network traffic

## Core versus Edge

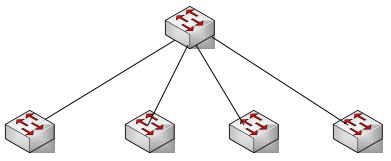

- Core network is the "core" of your network
  - Needs to have reliable power and air conditioning
  - May have multiple cores
  - Always route in the core
- Edge is toward the edges of your network
  - Provide service inside of individual buildings to individual computers
  - Always switch at the edge

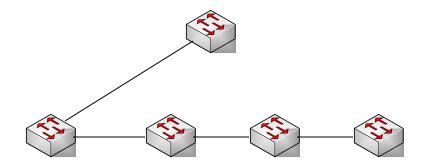

# Minimize Number of Network Devices in the Path

Build star networks

Not daisy chained networks

## Edge Networks (Layer 2 LANs)

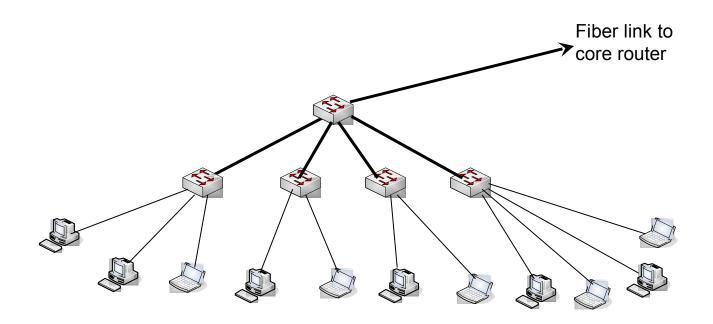

- Provides Service to end users
- Each of these networks will be an IP subnet
- Plan for no more than 250 Computers at maximum
- Should be one of these for every reasonable sized building
- This network should only be switched
- Always buy switches that are managed no unmanaged switches!

## **Edge Networks**

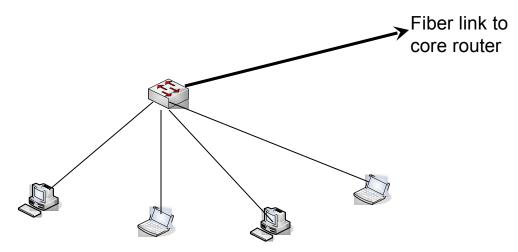

Make every network look like this:

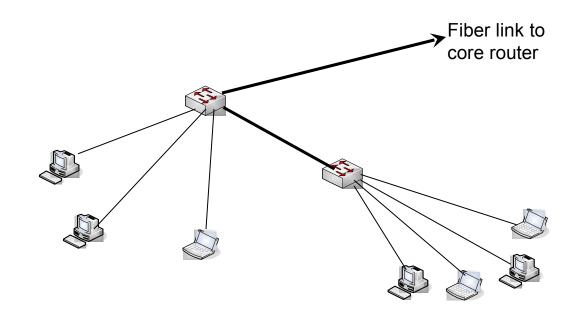

- Build Edge network incrementally as you have demand and money
- Start Small:

 Then as you need to add machines to the network, add a switch to get this:

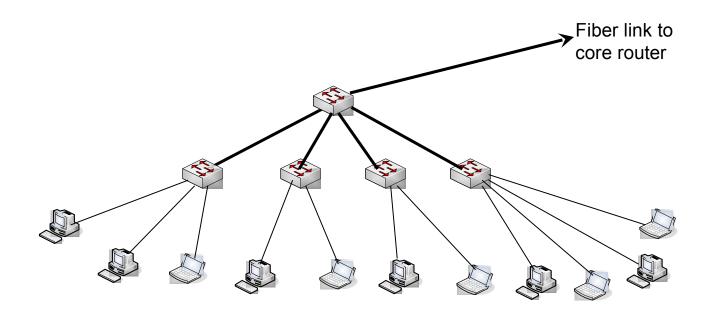

And keep adding switches to get to the final configuration

And keep adding switches to get to the final configuration

 Resist the urge to save money by breaking this model and daisy chaining networks or buildings together

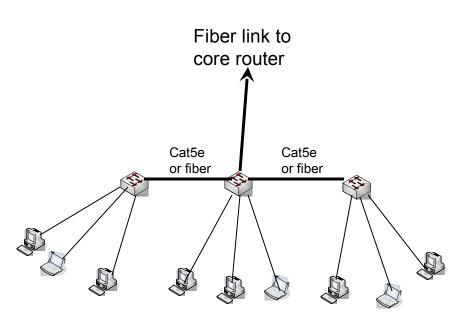

Try hard not to do this:

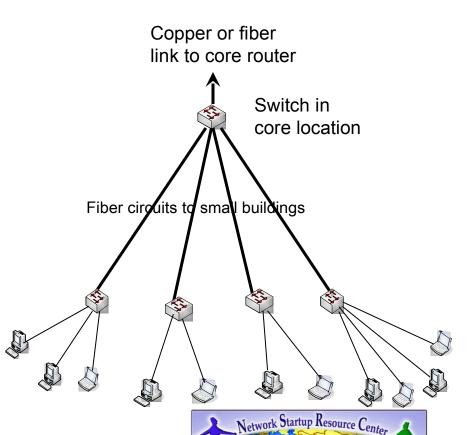

- There are cases where you can serve multiple small buildings with one subnet.
- Do it carefully.
- Two basic models:

UNIVERSITY OF OREGON

## Selected Layer 2 Topics

- Collision versus Broadcast Domain
- VLANs
- ARP how it works
- DHCP How it works
- Spanning Tree
- Link Aggregation
- Failure modes
  - 100 Mbs and Gigabit Duplex mismatch

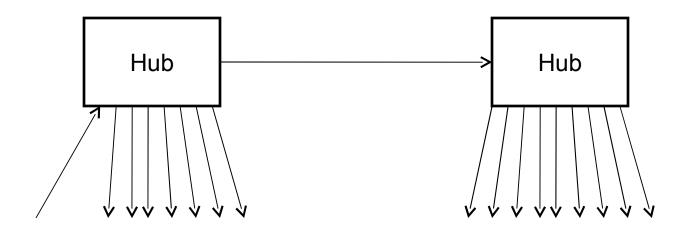

- Similar issues affects performance of LAN
- Hubs (Repeaters)
  - Every packet goes to every port, irrespective of destination of packet
  - Every port is half duplex
  - Can only be one packet in transit two transmitters = Collision

Hubs/Repeaters

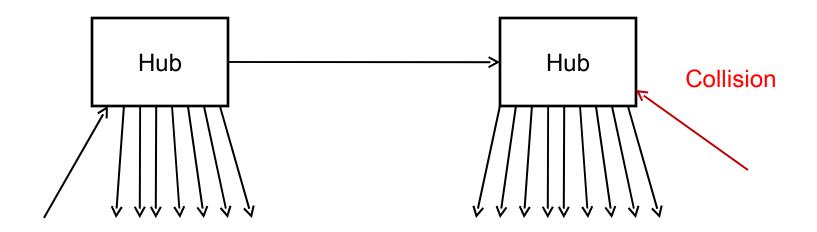

- Only One Packet at a time
- Every packet (even unicast) goes to every port

Hubs/Repeaters

Two Transmitters = Collision

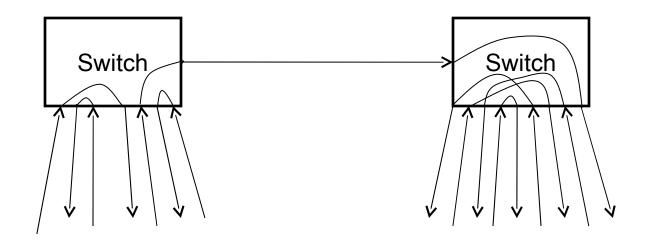

#### Switches

- Switches learn where hosts are eavesdropping on traffic and building a forwarding table
- Switches forward packets to correct port
- Can only be many packets in transit
- Broadcasts must go to all ports

#### Switches

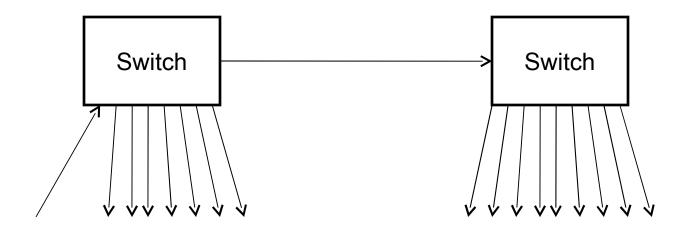

- Many packets can be in flight store and forward
- Unicast Packets go to intended destination

Switches

 Broadcasts go to all ports (notice this looks like the hubs picture some slides ago)

Switches

Switches need to know about multicast

#### **VLANs**

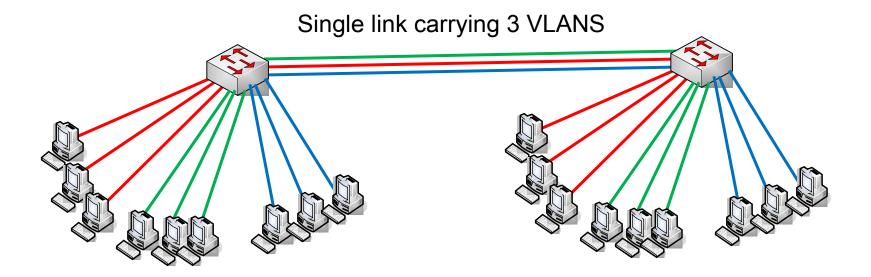

- Virtual LANs reduce scope of broadcast domain and separate traffic
- Tagging identifying the VLAN associated with a packet. Ports are configured as Tagged or untagged.
- Trunking Carrying traffic for multiple
   VLANs on a single link. Must use tagging.

### **VLANs**

Tagging on Trunks – must tag

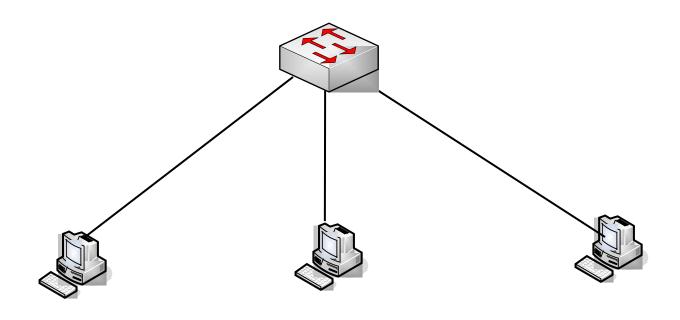

#### **ARP**

- Address Resolution Protocol
- Builds a mapping of IP address to Ethernet Address
- ARP Protocol
  - Broadcast ARP Request (who has this IP?)
  - Owner of IP address in ARP Request issues
     ARP reply

Network Startup Resource Center

Pathology: anyone can issue an ARP reply at any time

### **ARP**

10.0.0.1 00:00:11:00:00:aa 10.0.0.2 00:00:11:00:00:bb 10.0.0.3 00:00:11:00:00:cc

#### DHCP

- Dynamic Host Configuration Protocol
- Used to assign IP address and provide basic IP configuration to a host.
- Simple protocol
  - Client broadcasts a DHCP Discover
  - Server(s) unicast back a DHCP Offer
  - Client selects an offer and sends back a DHCP Ack to server
- Manage switches can block rogue DHCP

Network Startup Resource Center

## Spanning Tree

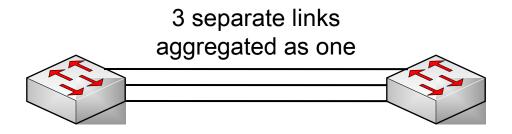

- Eliminates loops in Layer 2 networks
- Several flavors
  - Original Spanning Tree 802.1D
  - Rapid Spanning Tree (RSTP) 802.1w
  - Multiple Spanning Tree (MSTP) 802.1s and 802.1Q-2003
- Modern managed switches can do all of the above

## Link Aggregation

- Bonds multiple channels together to provide more bandwidth
- Issues:
  - Compatibility
  - How traffic is scheduled

#### Failure Modes

- Loops in your network
- Rogue DHCP servers
- Duplex mis-match
  - 100Mbs late collisions and CRC
  - 1000Mbs can't establish link
- Need managed switches to correct these

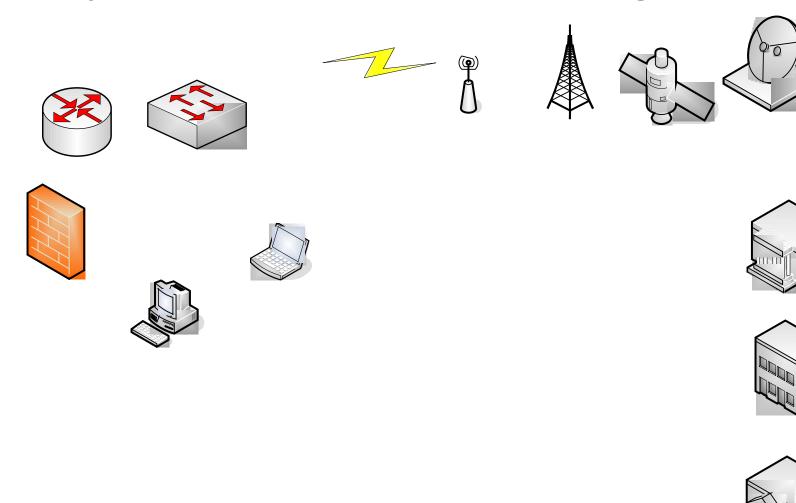

## **Thanks**

Questions?
