

IPv6 on router

Tsegereda Beyene and Benoit Lourdelet

tbeyene@cisco.com, blourdel@cisco.com

Agenda

- **Router Basis**
 - Addressing
 - Neighbor discovery
 - Renumbering
- **Enabling IPv6 on Ethernet with EUI-64**
- **Enabling Static Routes**
- **Enabling RIPng**
- **Enabling OSPFv3**
- **Setup an IPv6/IPv4 tunnel : 6to4**
- **Enabling MP-BGP on the tunnel**

IPv6 Router addresses

- **A router is required to recognize all addresses that a host is required to recognize, plus the following addresses as identifying itself:**

The Subnet-Router Anycast Addresses for all interfaces for which it is configured to act as a router.

All other Anycast Addresses with which the router has been configured.

The All-Routers Multicast Addresses

Enabling IPv6 on Cisco

- To enable IPv6 on a Cisco router, you must:

Enable IPv6 traffic forwarding

`ipv6 unicast-routing`

Enable IPv6 on the interface(s) by configuring an IPv6 address on the interface

`ipv6 address <ipv6addr>[/<prefix-length>]`

`ipv6 enable`

Can be used, but only for link-local addresses

IOS IPv6 Addressing Examples

LAN: 3ffe:b00:c18:1::/64

Ethernet0

```
interface Ethernet0  
  ipv6 address 2001:410:213:1::/64 eui-64
```

MAC address: 0060.3e47.1530

```
router# show ipv6 interface Ethernet0  
Ethernet0 is up, line protocol is up  
  IPv6 is enabled, link-local address is FE80::260:3EFF:FE47:1530  
Global unicast address(es):  
  2001:410:213:1:260:3EFF:FE47:1530, subnet is 2001:410:213:1::/64  
Joined group address(es):  
  FF02::1:FF47:1530  
  FF02::1  
  FF02::2  
MTU is 1500 bytes
```

Configuring Interfaces

Objectives

- **Enable IPv6 on the router**
- **Configure an Ethernet interface for IPv6**
- **Identify which addresses are used on a router**
- **Test basic link-local connectivity**

Configuring Interfaces on a Router

- **Configuring the IPv6 Ethernet Interface**

 - Enable IPv6 on the router.

 - Enable IPv6 on the LAN interface

- **Link-local Addresses**

 - Find the link-local address of the Ethernet interface.

 - Multicast addresses ?

Lab 1 – Configuring Interfaces Router

```
R1#sh ipv6 int e0
Ethernet0 is up, line protocol is up
  IPv6 is enabled, link-local address is FE80::200:CFF:FE3A:8B18
  No global unicast address is configured
  Joined group address(es):
    FF02::1
    FF02::2
    FF02::1:FF3A:8B18
  MTU is 1500 bytes
  ICMP error messages limited to one every 100 milliseconds
  ICMP redirects are enabled
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
  ND advertised reachable time is 0 milliseconds
  ND advertised retransmit interval is 0 milliseconds
  ND router advertisements are sent every 200 seconds
  ND router advertisements live for 1800 seconds
  Hosts use stateless autoconfig for addresses.
```

```
R1#
```

Configuring Interfaces Connectivity

```
R1#sh ipv6 neighbors
```

IPv6 Address	Age	Link-layer Addr	State	Interface
FE80::210:A4FF:FE91:43B9	0	0010.a491.43b9	REACH	Ethernet0

```
R1#
```

```
R1#sh ipv6 neighbors
```

IPv6 Address	Age	Link-layer Addr	State	Interface
FE80::210:A4FF:FE91:43B9	0	0010.a491.43b9	STALE	Ethernet0

```
R1#
```

- **Verifying the IPv6 Link-local Connectivity**
From the PC (ping6)
or from the router using the link-local address
- **Verify the list of IPv6 neighbors.**

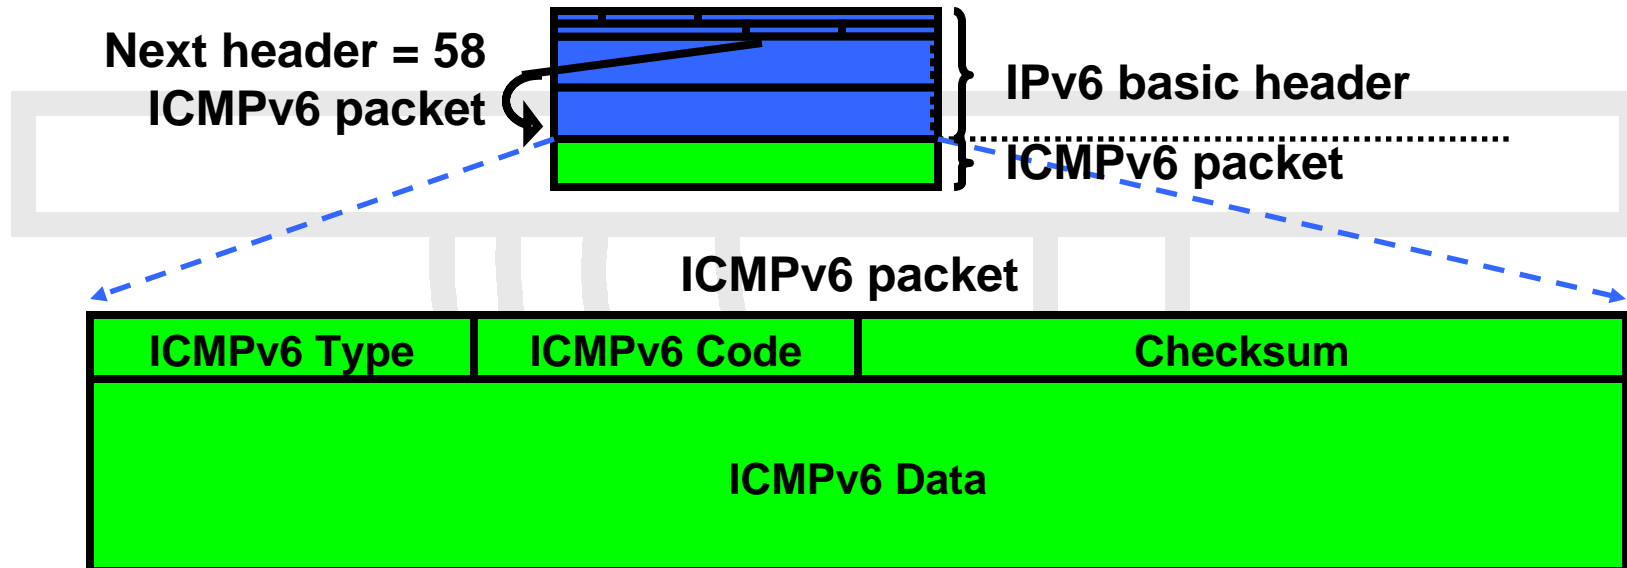

Neighbor Discovery

ICMPv6

- **ICMPv6 is similar to IPv4:**
 - Provides diagnostic and error messages
 - Is used for path MTU discovery

ICMPv6

460 4.958834 fe80::2e0:18ff:fe88:d853 fe80::200:cff:fe3a:8b18 ICMPv6 Echo request

- Frame 460 (118 on wire, 118 captured)
- Ethernet II
 - Destination: 00:00:0c:3a:8b:18 (Cisco_3a:8b:18)
 - Source: 00:e0:18:88:d8:53 (ASUSTEK_88:d8:53)
 - Type: IPv6 (0x86dd)

```

Neighbor Discovery (RFC 2461)

- **Protocol built on top of ICMPv6 (RFC 2463)**

Combination of IPv4 protocols (ARP, ICMP,...)

- **Neighbor Discovery:**

Determines the link-layer address of a neighbor on the same link

Duplicate Address Detection

Finds neighbor routers, Keeps track of neighbors

- **Defines 5 ICMPv6 packet types**

Router Solicitation / Router Advertisements

Neighbor Solicitation / Neighbor Advertisements

Redirect

Neighbor Discovery (RFC 2461)

- **Defined mechanisms between nodes attached on the same link**
 - Router discovery
 - Prefix discovery
 - Parameters discovery, ie: link MTU, hop limit,...
 - Address autoconfiguration
 - Address Resolution (same function as ARP)
 - Next-hop determination
 - Neighbor Unreachability Detection (useful for default routers)
 - Duplicate Address Detection
 - Redirect

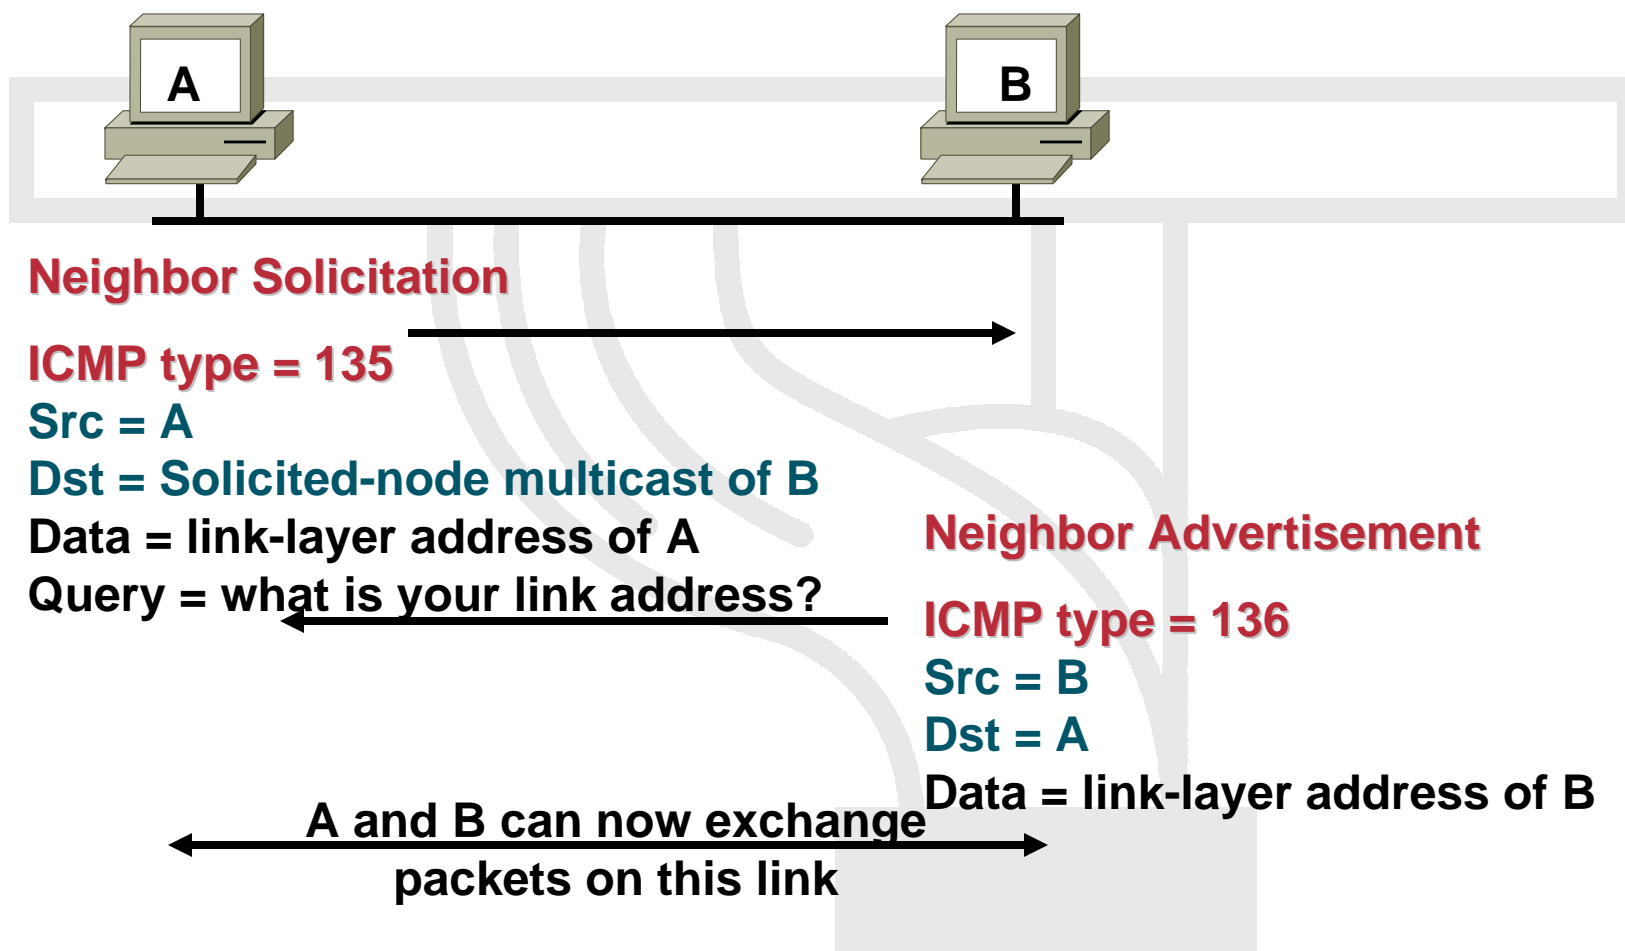

Solicited-Node Multicast Address

- A solicited-node address is a:
 - Multicast address with a link-local scope
 - Formed by a prefix and the rightmost 24 bits of the aggregatable address

Neighbor Solicitation

Neighbor Solicitation

The screenshot displays the Wireshark interface with a packet capture of ICMPv6 Neighbor Solicitation. The packet list pane shows several packets, with packet 23 selected. The packet details pane shows the structure of this packet, including Ethernet II, Internet Protocol Version 6, and Internet Control Message Protocol v6 (Neighbor Solicitation). The packet bytes pane shows the raw hex and ASCII data.

No.	Time	Source	Destination	Protocol	Info

Router Advertisements (RA)

RA packet definitions:

ICMP Type = 134

Src = Router Link-local Address

Dst = All-nodes multicast address

Data= options, prefix, lifetime, autoconfig flag

- **Routers send periodic Router Advertisements (RA) to the all-nodes multicast address.**

Router Solicitations

RS packet definitions:

ICMP Type = 133

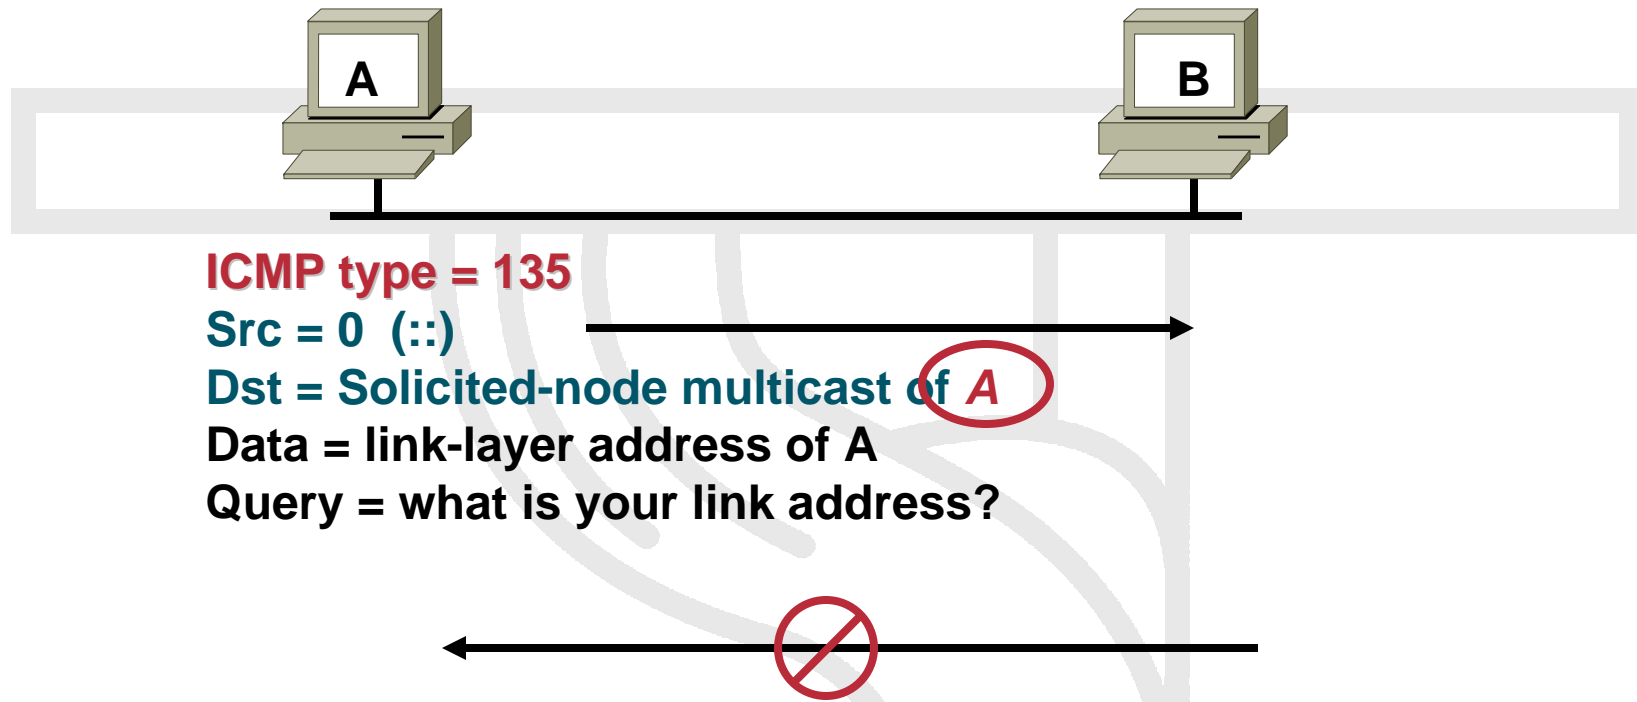

Src = Unspecified Address

Dst = All-routers multicast address

- At boot time, nodes send Router Solicitations to receive promptly Router Advertisements.

Duplicate Address Detection

- Duplicate Address Detection (DAD) uses neighbor solicitation to verify the existence of an address to be configured.

IPv6 Auto-Configuration

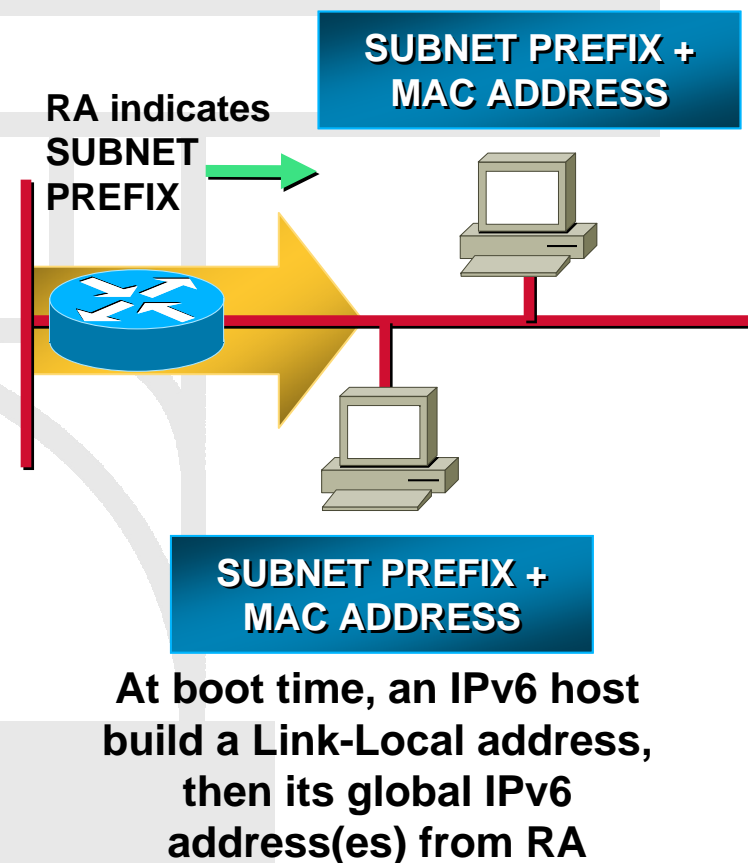

- **Stateless (RFC2462)**

Host autonomously configures its own Link-Local address

Router solicitation are sent by booting nodes to request RAs for configuring the interfaces.

- **Stateful**

DHCPv6

Stateless Autoconfiguration

1. RS:

ICMP Type = 133

Src = ::

**Dst = All-Routers multicast
Address**

query= please send RA

2. RA:

ICMP Type = 134

Src = Router Link-local Address

Dst = All-nodes multicast address

**Data= options, prefix, lifetime,
autoconfig flag**

- Router solicitations are sent by booting nodes to request RAs for configuring the interfaces.

Address Lifetime

- **Tentative** : the address is in the process of being verified as unique
- **Preferred** : a node can send and receive unicast traffic to and from a preferred address
- **Deprecated** : the address is still valid, but using it for new communication is discouraged
- **Invalid** : the address can no longer send unicast traffic to or receive it from a node. An address enters this state after the valid lifetime expires.

DHCPv6

- Updated version of DHCP for IPv4.
- Supports new addressing.
- Enables more control than stateless auto-configuration.
- Can be used for renumbering.
- Can be used for automatic domain name registration of hosts using dynamic DNS.

DHCPv6 - Process

- Same as in IPv4, but:

Client first detect the presence of routers on the link.

If found, then examines router advertisements to determine if DHCP can be used.

If no router found or if DHCP can be used, then

DHCP Solicit message is sent to the All-DHCP-Agents multicast address

Using the link-local address as the source address

Renumbering

RA packet definitions:

ICMP Type = 134

Src = Router Link-local Address

Dst = All-nodes multicast address

Data= 2 prefixes:

Current prefix (to be deprecated) with short lifetime

New prefix (to be used) with normal lifetime

- Renumbering is achieved by modifying the RA to announce the old prefix with a short lifetime and the new prefix.

IOS Prefix Renumbering Scenario

```
ipv6 nd prefix-advertisement <routing-prefix>/<length>  
<valid-lifetime> <preferred-lifetime> [onlink | autoconfig]
```

Router configuration **before** renumbering:

```
interface Ethernet0  
  ipv6 nd prefix-advertisement 3ffe:b00:c18:1::/64 43200 43200 onlink autoconfig
```

Network prefix: 3ffe:b00:c18:1::/64

Router advertisements

Autoconfiguring
IPv6 hosts

Host configuration:

```
preferred address 3ffe:b00:c18:1:260:8ff:fede:8fbe
```

IOS Prefix Renumbering Scenario

```
ipv6 nd prefix-advertisement <routing-prefix>/<length>  
<valid-lifetime> <preferred-lifetime> [onlink | autoconfig]
```

Router configuration **after** renumbering:

```
interface Ethernet0  
  ipv6 nd prefix-advertisement 3ffe:b00:c18:1::/64 43200 0 onlink autoconfig  
  ipv6 nd prefix-advertisement 3ffe:b00:c18:2::/64 43200 43200 onlink autoconfig
```

NEW network prefix: 3ffe:b00:c18:2::/64
Deprecated prefix: 3ffe:b00:c18:1::/64

← Router advertisements

Autoconfiguring
IPv6 hosts

Host configuration:

```
deprecated address 3ffe:b00:c18:1:260:8ff:fede:8fbe  
preferred address 3ffe:b00:c18:2:260:8ff:fede:8fbe
```

Neighbor Discovery

- **Configure a router to send router advertisements**
- **Configure a network to use global addresses**
 - Configure EUI-64 addresses
 - Configure with a fixed manual interface-id
- **Renumber a network**

Neighbor Discovery

- **Configure a global IPv6 address on the LAN interface using the /64 prefix of your subnet and the EUI-64 format for the host part of the address**

Neighbor Discovery

- **Look at the config of the PC and see if it has received a global address.**
- **Enable the debugging mode for IPv6 Neighbor Discovery.**
- **Enable router advertisements by using the neighbor discovery command with the subnet prefix assigned to your LAN.**
- **Since we don't want infinite lifetimes, use 5 minutes (300 seconds) for the lifetime (both preferred and valid).**
- **Verify connectivity using the ping command on the Cisco router to the PC using the new assigned address of the PC as the ping destination address.**

Neighbor Discovery

Renumbering the Local Network

- **Configure the new address of the LAN interface by using the new global subnet prefix assigned to your LAN (See Topology slide 2)**

Use a manual interface-id instead of EUI-64

- **Enable router advertisements by using the neighbor discovery command with the NEW subnet prefix assigned to your LAN**
- **Verify that your PC has a new address with the new prefix.**

Neighbor Discovery

Renumbering the Local Network

- **Modify the Neighbor Advertisements for the old prefix by making the preferred lifetime equals to zero**
- **Verify that your PC now deprecates the use of the “old” address prefix and prefer the new one.**
- **Verify the connectivity with a ping from the Cisco to the PC using the new assigned address of the PC.**

IOS Prefix Renumbering

Original Prefix 2006:1/64

```
!  
interface Ethernet0  
  ipv6 address 2006:1::1/64  
  ipv6 nd ra-interval 60  
  ipv6 nd prefix-advertisement 2006:1::/64 10000 6000 onlink autoconfig  
!
```

IOS Prefix Renumbering Example

Original Prefix 2006:1/64

```
R1#sh ipv6 int ethernet 0
Ethernet0 is up, line protocol is up
  IPv6 is enabled, link-local address is FE80::200:CFF:FE3A:8B18
  Global unicast address(es):
    2006:1::1, subnet is 2006:1::/64
  Joined group address(es):
    FF02::1
    FF02::2
    FF02::1:FF3A:8B18
    FF02::1:FF00:1
  MTU is 1500 bytes
  ICMP error messages limited to one every 100 milliseconds
  ICMP redirects are enabled
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
  ND advertised reachable time is 0 milliseconds
  ND advertised retransmit interval is 0 milliseconds
  ND router advertisements are sent every 200 seconds
  ND router advertisements live for 1800 seconds
  Hosts use stateless autoconfig for addresses.
```

R1#

```
R1#sh int ethernet 0
Ethernet0 is up, line protocol is up
  Hardware is Lance, address is
  0000.0c3a.8b18 (bia 0000.0c3a.8b18)
```

IOS Prefix Renumbering Example

Windows

```
D:\>ipv6 if 4
Interface 4 (site 1): Local Area Connection
  uses Neighbor Discovery
  link-level address: 00-10-a4-91-43-b9
    tentative address 2006:1::210:a4ff:fe91:43b9, 10000s/6000s (addrconf)
    tentative address fe80::210:a4ff:fe91:43b9, infinite/infinite
  multicast address ff02::1, 1 refs, not reportable
  multicast address ff02::1:ff91:43b9, 2 refs, last reporter, 9 seconds until
report
  link MTU 1372 (true link MTU 1372)
  current hop limit 64
  reachable time 35500ms (base 30000ms)
  retransmission interval 1000ms
  DAD transmits 1

D:\>
```

IOS Prefix Renumbering Example

Windows

```
D:\>ipv6 if 4
Interface 4 (site 1): Local Area Connection
  uses Neighbor Discovery
  link-level address: 00-10-a4-91-43-b9
    preferred address 2006:1::210:a4ff:fe91:43b9, 9963s/5963s (addrconf)
    preferred address fe80::210:a4ff:fe91:43b9, infinite/infinite
  multicast address ff02::1, 1 refs, not reportable
  multicast address ff02::1:ff91:43b9, 2 refs, last reporter
  link MTU 1372 (true link MTU 1372)
  current hop limit 64
  reachable time 35500ms (base 30000ms)
  retransmission interval 1000ms
  DAD transmits 1

D:\>
```

IOS Prefix Renumbering Example

New Prefix 2008:1/64

```
!  
interface Ethernet0  
  ipv6 address 2006:1::1/64  
  ipv6 nd ra-interval 60  
  ipv6 nd prefix-advertisement 2006:1::/64 10000 0 onlink autoconfig  
  ipv6 nd prefix-advertisement 2008:1::/64 10000 8000 onlink autoconfig  
!
```

IOS Prefix Renumbering Example

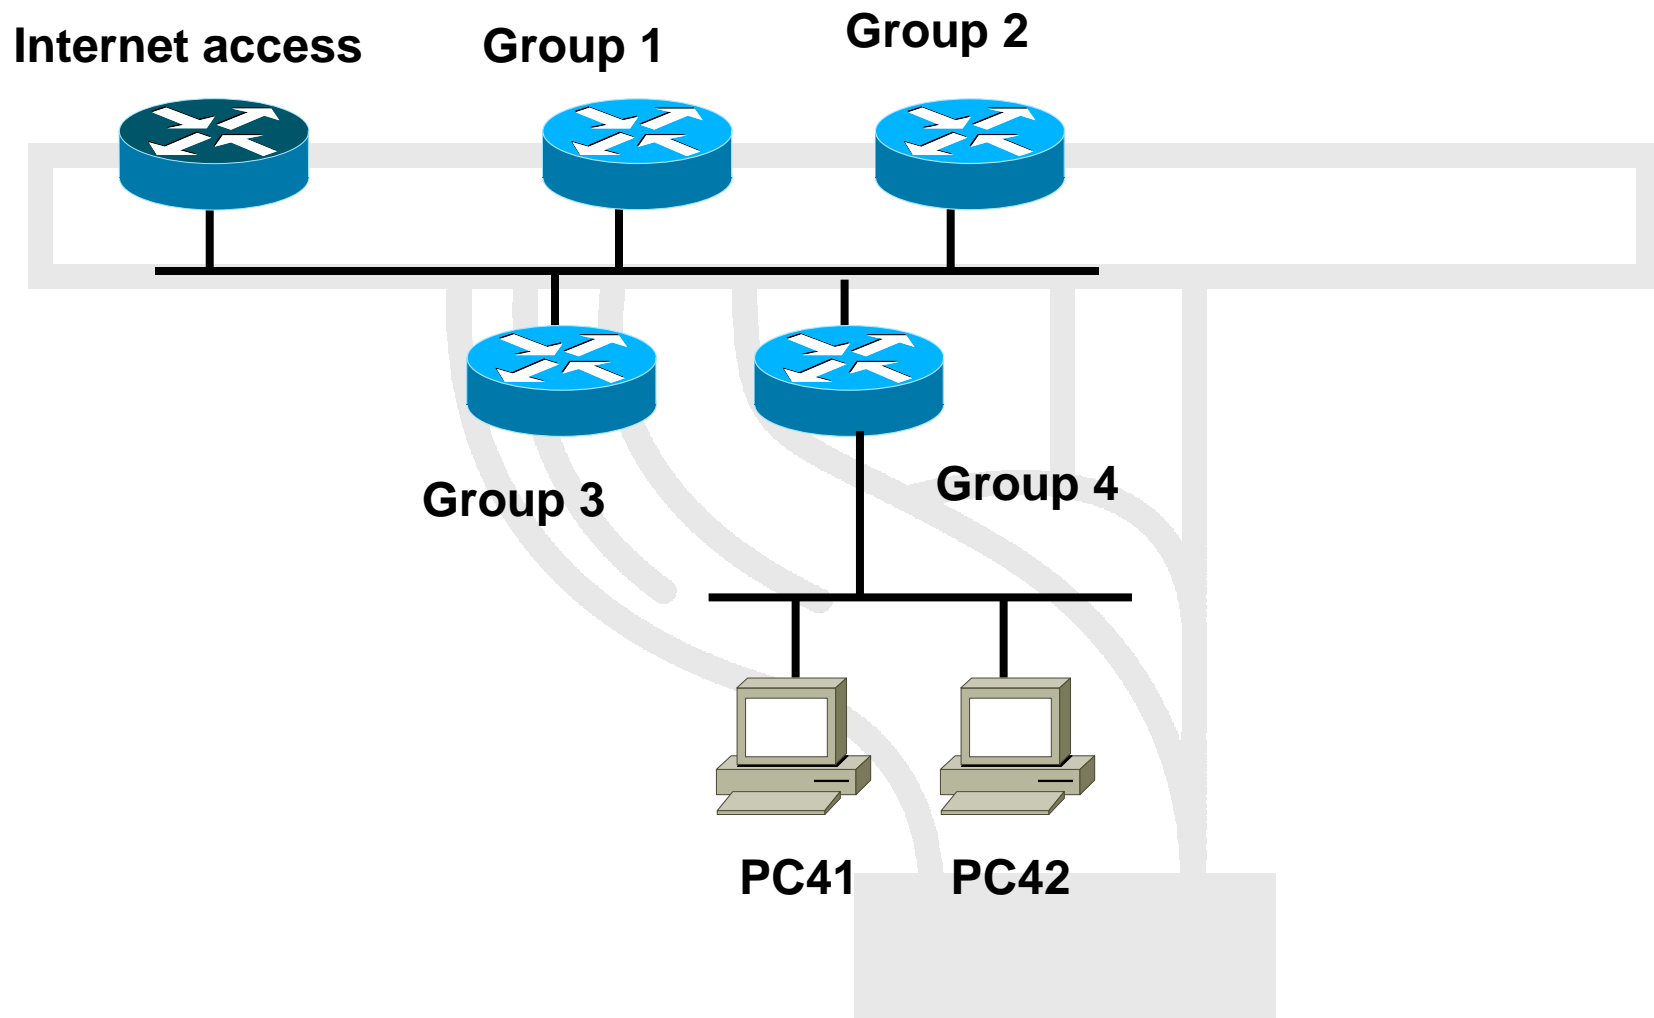

Windows display

```
D:\>ipconfig if 4
Interface 4 (site 1): Local Area Connection
    uses Neighbor Discovery
    link-level address: 00-10-a4-91-43-b9
        preferred address 2008:1::210:a4ff:fe91:43b9, 9990s/7990s (addrconf)
        deprecated address 2006:1::210:a4ff:fe91:43b9, 9990s/0s (addrconf)
        preferred address fe80::210:a4ff:fe91:43b9, infinite/infinite
        multicast address ff02::1, 1 refs, not reportable
        multicast address ff02::1:ff91:43b9, 3 refs, last reporter
    link MTU 1372 (true link MTU 1372)
    current hop limit 64
    reachable time 35500ms (base 30000ms)
    retransmission interval 1000ms
    DAD transmits 1

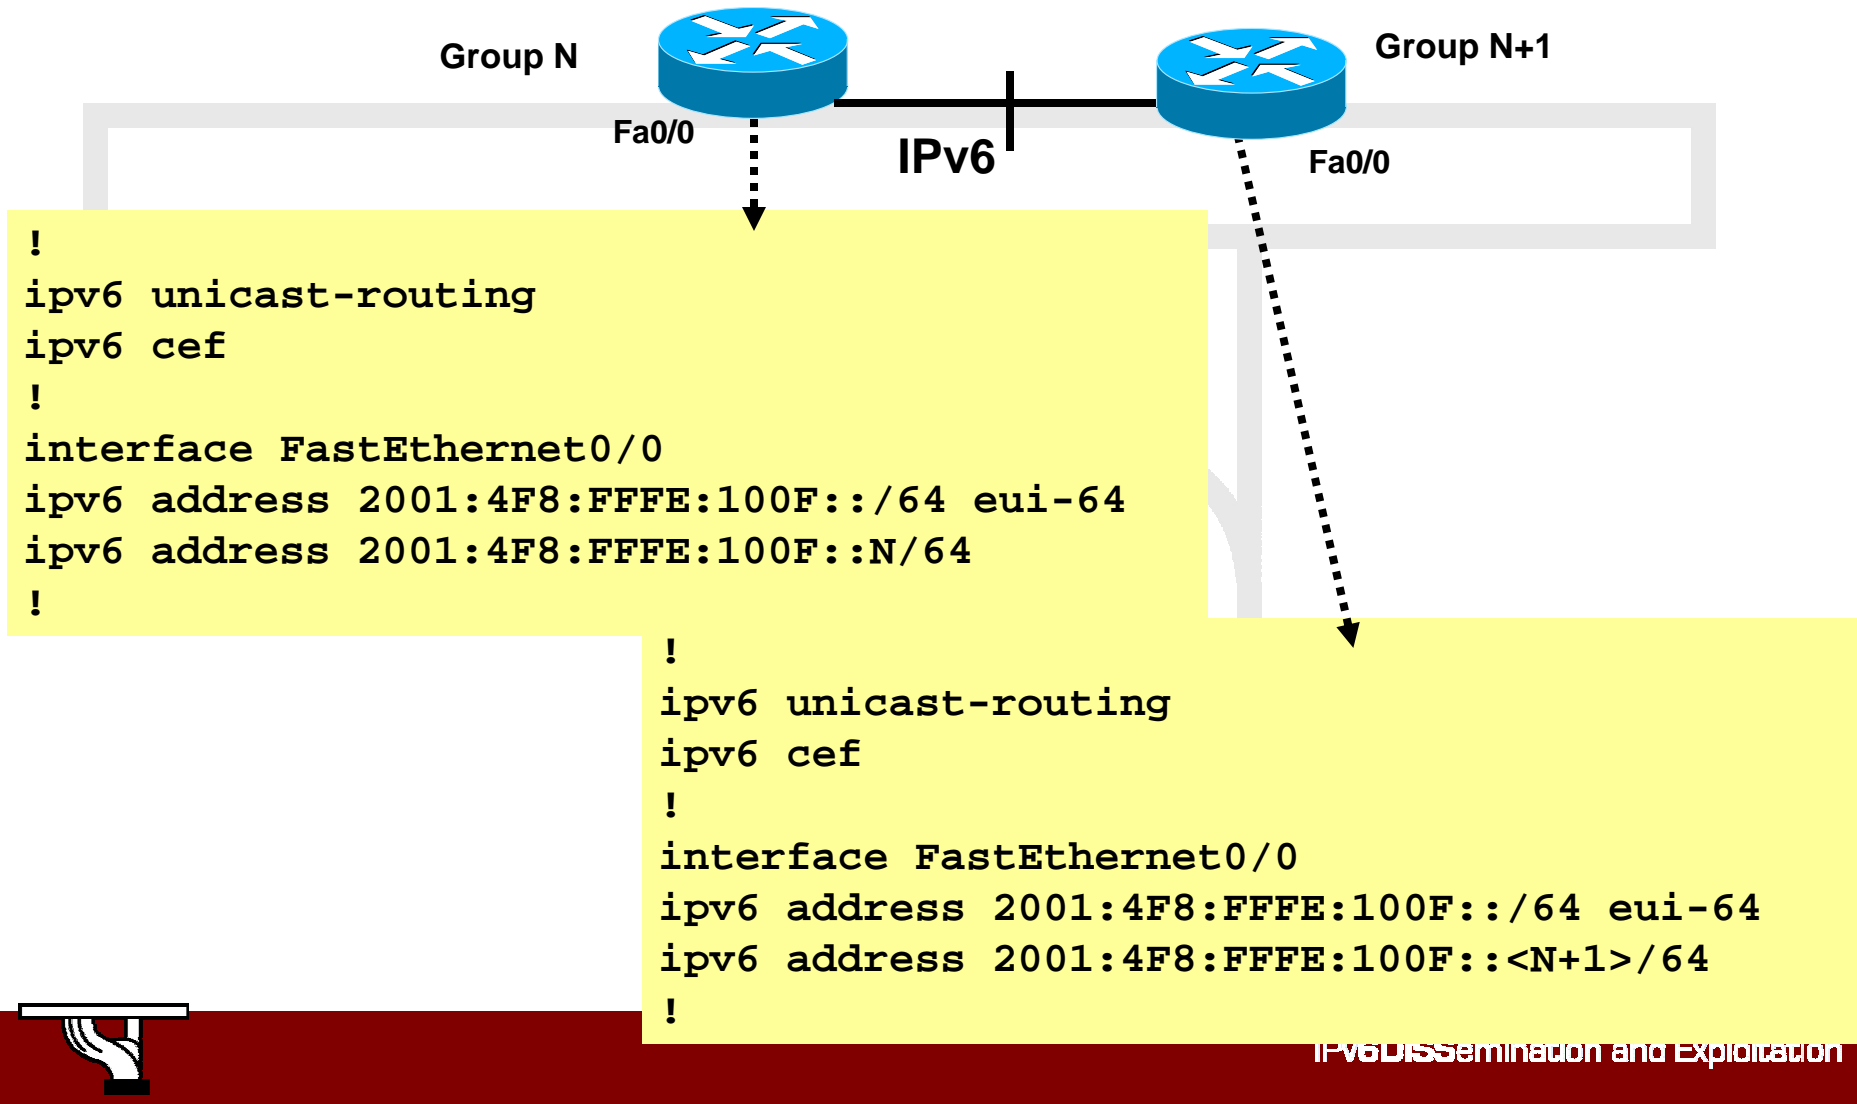

D:\>
```

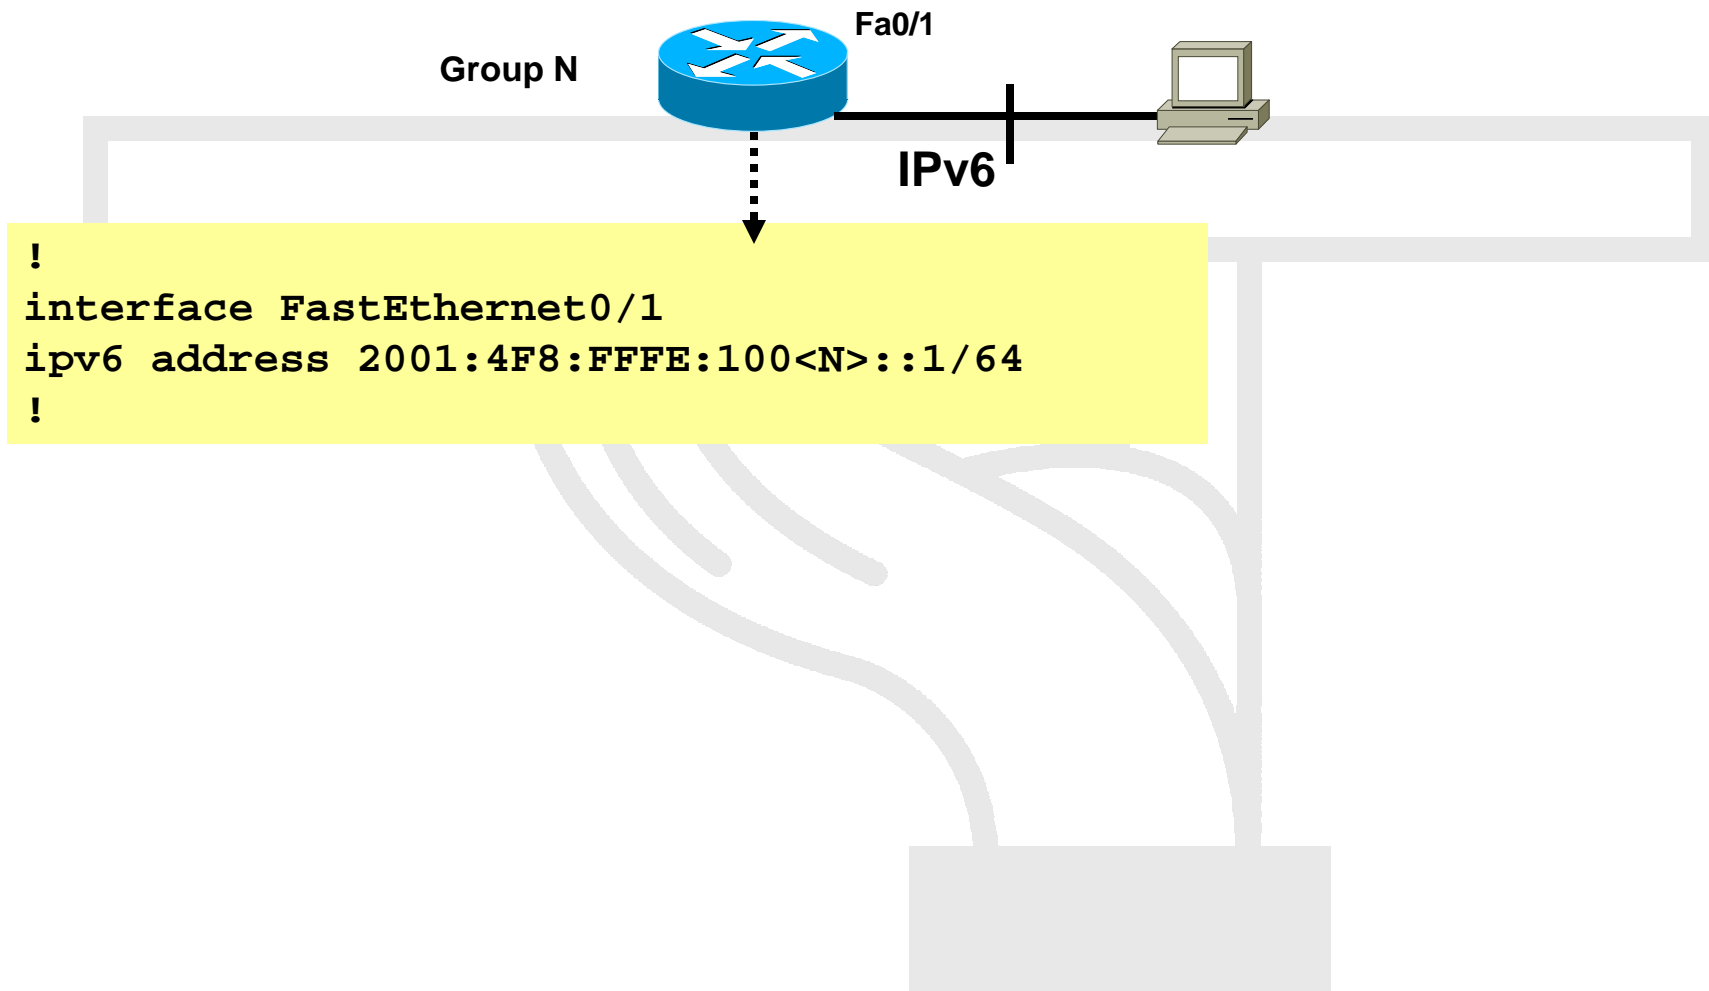

Lab setup

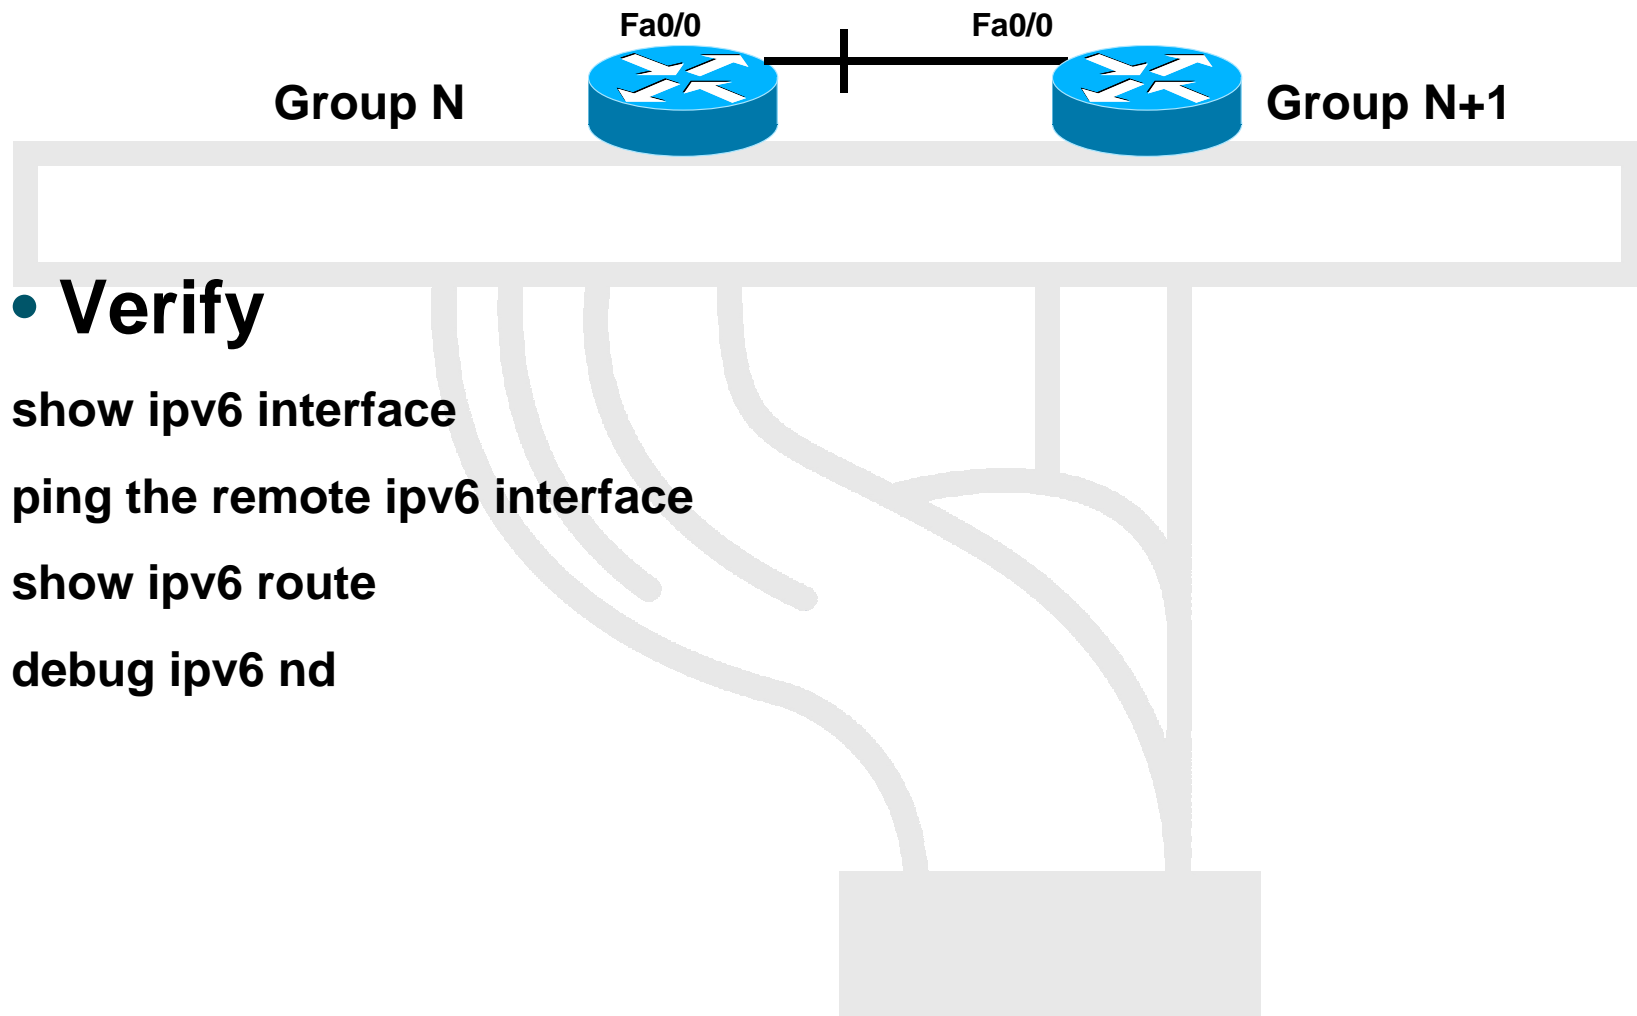

Enable IPv6 on Ethernet 0/0 with EUI-64

Numbering a PC

Verifying IPv6

- **Verify**

show ipv6 interface

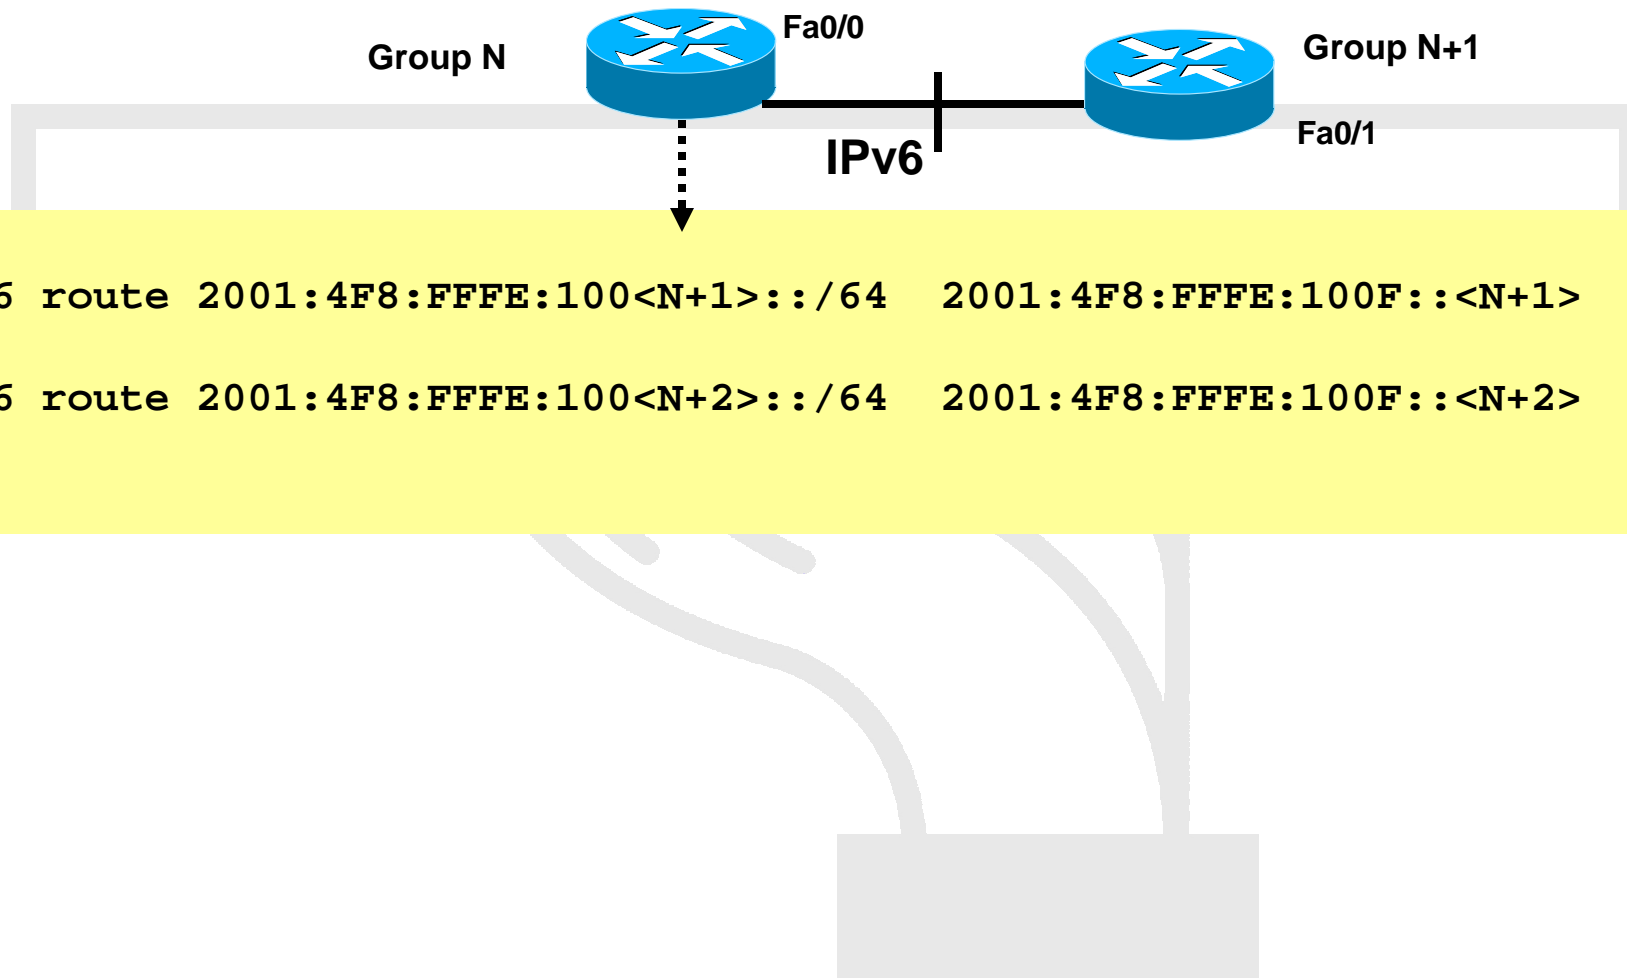

ping the remote ipv6 interface

show ipv6 route

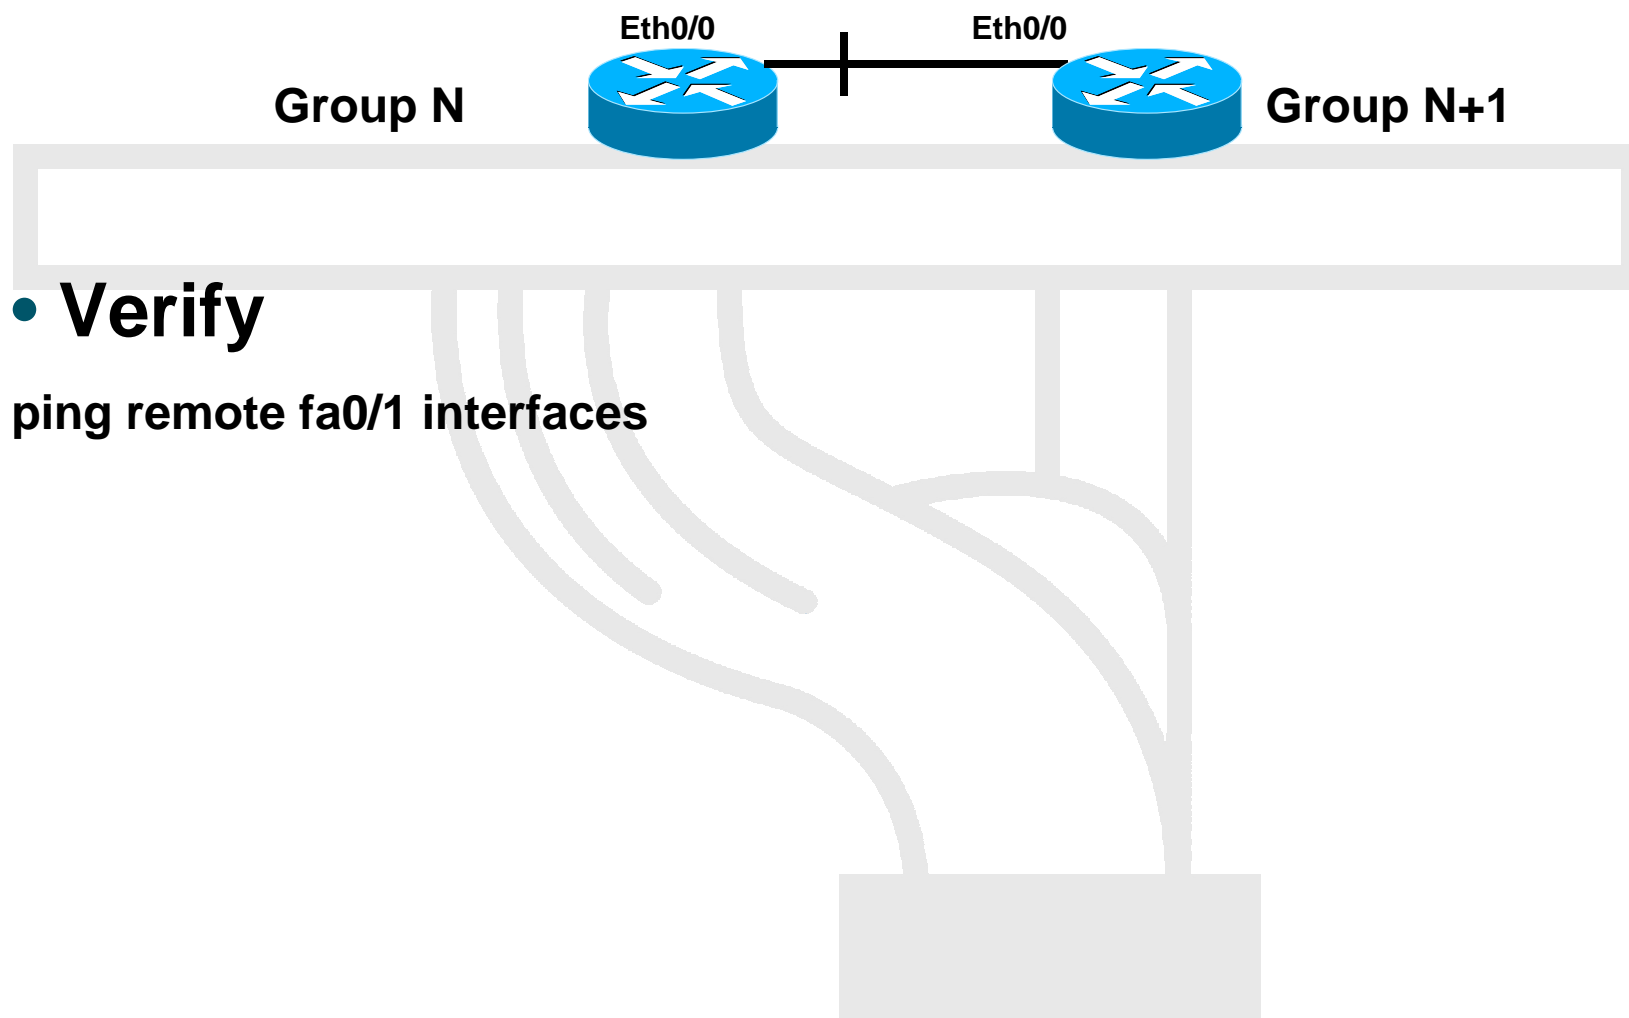

debug ipv6 nd

Configuring IPv6 static routes

Verifying IPv6 static routes

- **Verify**

ping remote fa0/1 interfaces

RIPng

- **RFC 2080 describes RIPng**

- **Same as IPv4**

Distance-vector, 15 hop Radius, split-horizon, poison reverse, etc..

Based on RIPv2

- **Updated Features for IPv6**

Uses IPv6 for transport

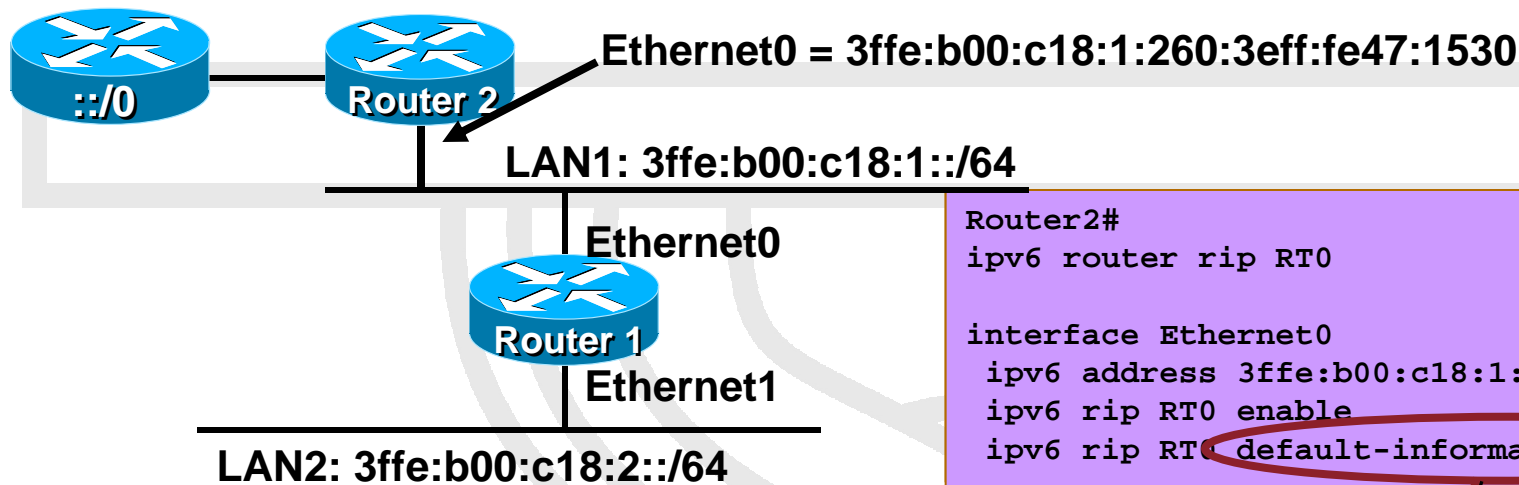

IPv6 prefix, next-hop IPv6 address

Uses the multicast group FF02::9 for RIP updates

Updates are sent on UDP port 521

Enhanced Routing Protocol Support RIPng Configuration and Display

```
Router2#
ipv6 router rip RT0

interface Ethernet0
  ipv6 address 3ffe:b00:c18:1::/64 eui-64
  ipv6 rip RT0 enable
  ipv6 rip RT0 default-information originate
```

```
Router1#
ipv6 router rip RT0

interface Ethernet0
  ipv6 address 3ffe:b00:c18:1::/64 eui-64
  ipv6 rip RT0 enable
Interface Ethernet1
  ipv6 address 3ffe:b00:c18:2::/64 eui-64
  ipv6 rip RT0 enable
```

```
Router2# debug ipv6 rip
RIPng: Sending multicast update on Ethernet0 for RT0
src=FE80::260:3eff:fe47:1530
dst=FF02::9 (Ethernet0)
sport=521, dport=521, length=32
command=2, version=1, mbr=20, #rtr=1
tag=0, metric=1, prefix=::/0
```

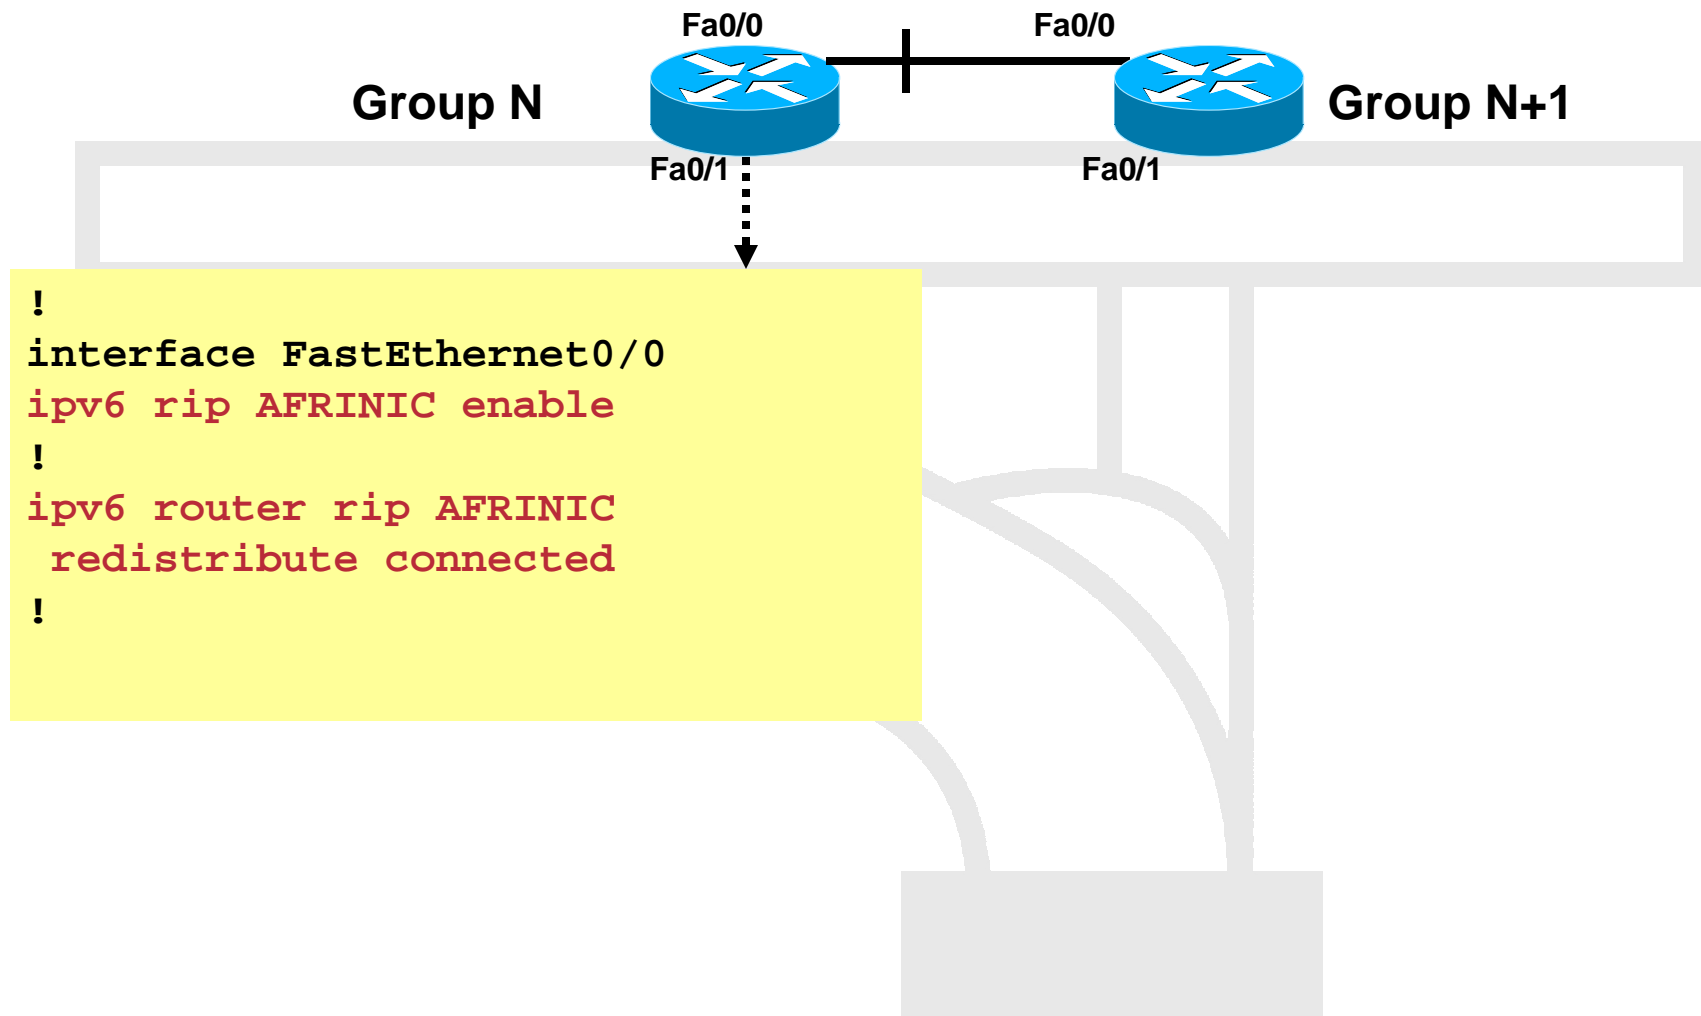

Multicast all
Rip-Routers

Link-local

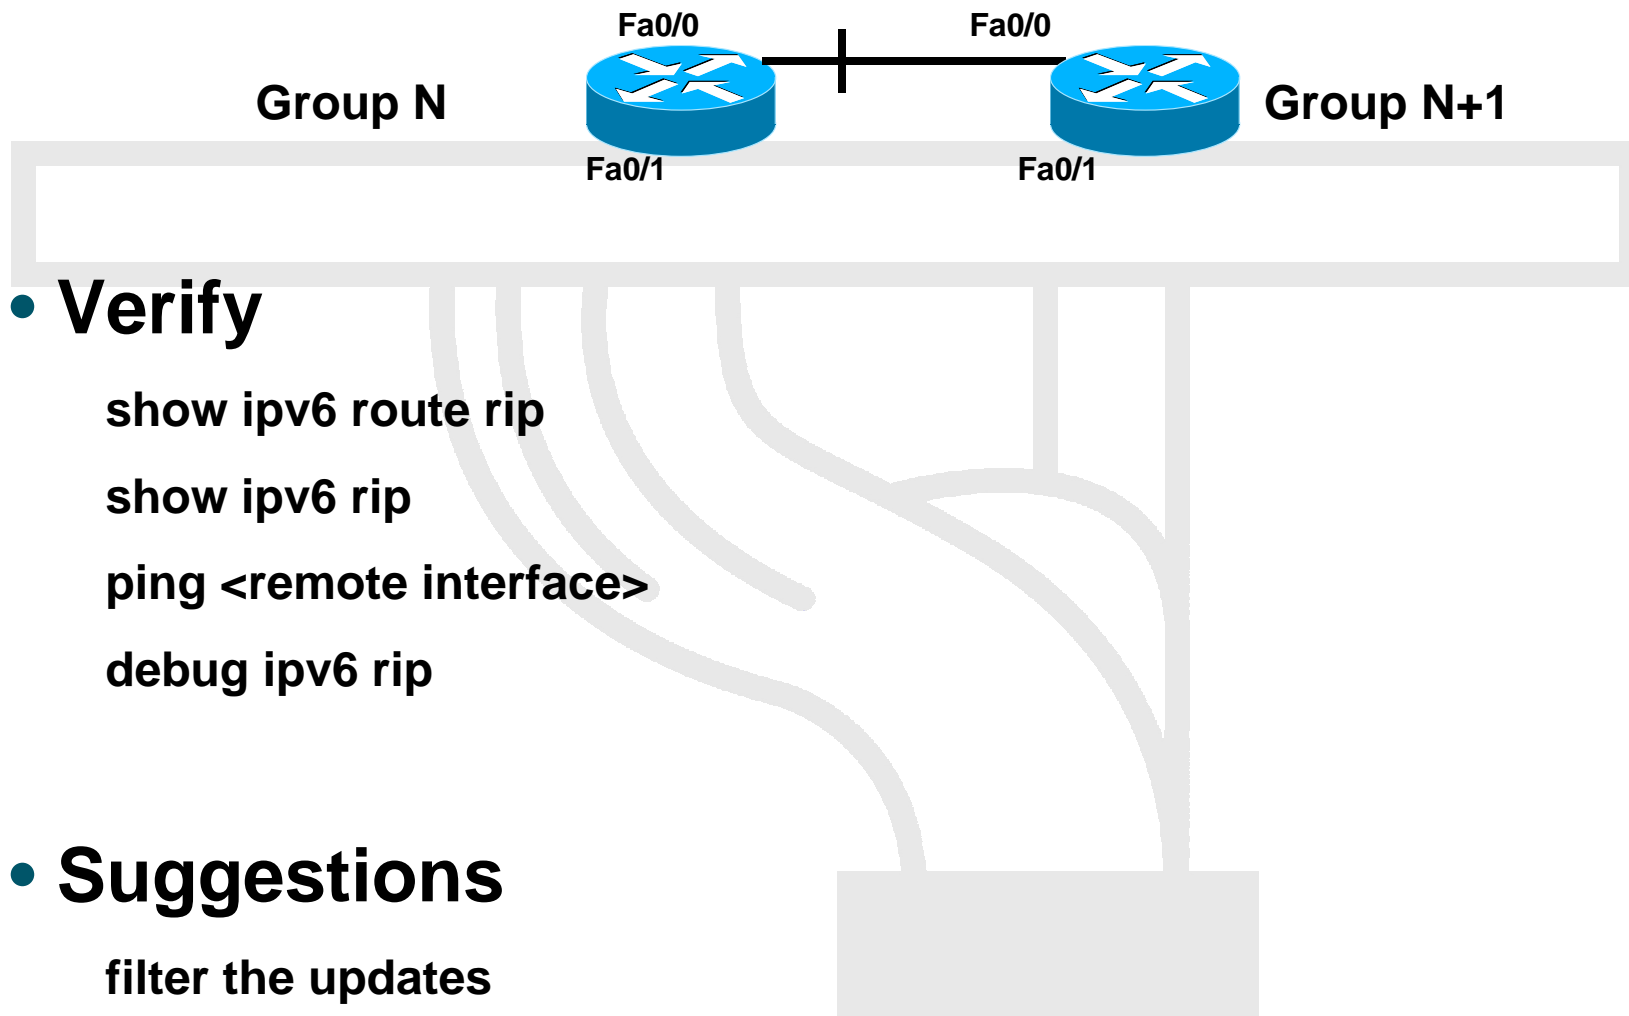

src address

IPv6 DIS Seminar and Exhibition

Enabling RIPng

Enable RIPng - verifying

- **Verify**

- show ipv6 route rip
- show ipv6 rip
- ping <remote interface>
- debug ipv6 rip

- **Suggestions**

- filter the updates

announce more prefixes (create lookback interfaces)

OSPFv2

- **April 1998 was the most recent revision (RFC 2328)**
- **OSPF uses a 2-level hierarchical model**
- **SPF calculation is performed independently for each area**
- **Typically faster convergence than DVRPs**
- **Relatively low, steady state bandwidth requirements**

OSPFv3 overview

- **OSPF for IPv6**
- **Based on OSPFv2, with enhancements**
- **Distributes IPv6 prefixes**
- **Runs directly over IPv6**
- **Ships-in-the-night with OSPFv2**

OSPFv3 / OSPFv2 Similarities

- **Basic packet types**

Hello, DBD, LSR, LSU, LSA

- **Mechanisms for neighbor discovery and adjacency formation**
- **Interface types**
P2P, P2MP, Broadcast, NBMA, Virtual
- **LSA flooding and aging**
- **Nearly identical LSA types**

OSPFv3 / OSPFv2 Differences

- **OSPFv3 runs over a link, rather than a subnet**
- **Multiple instances per link**
- **OSPFv2 topology not IPv6-specific**
 - Router ID
 - Link ID
- **Standard authentication mechanisms**
- **Uses link-local addresses**
- **Generalized flooding scope**
- **Two new LSA types**

Configuring OSPFv3 in Cisco IOS® Software

- **Similar to OSPFv2**

Prefixing existing Interface and Exec mode commands with “ipv6”

- **Interfaces configured directly**

Replaces `network` command

- **“Native” IPv6 router mode**

Not a sub-mode of `router ospf`

Configuration Modes in OSPFv3

- **Entering router mode**

`[no] ipv6 router ospf <process ID>`

- **Entering interface mode**

`[no] ipv6 ospf <process ID> area <area ID>`

- **Exec mode**

`[no] show ipv6 ospf [<process ID>]`

`clear ipv6 ospf [<process ID>]`

Cisco IOS OSPFv3 Specific Attributes

- **Configuring area range**

`[no] area <area ID> range <prefix>/<prefix length>`

- **Showing new LSA**

`show ipv6 ospf [<process ID>] database link`

`show ipv6 ospf [<process ID>] database prefix`

OSPFv3 configuration example

```
Router1#  
interface Ethernet0  
  ipv6 address 2001:1:1:1::1/64  
  ipv6 ospf 1 area 0  
  
interface Ethernet1  
  ipv6 address 2001:2:2:2::2/64  
  ipv6 ospf 1 area 1  
  
ipv6 router ospf 1  
  router-id 1.1.1.1  
  area 1 range 2001:2:2::/48
```

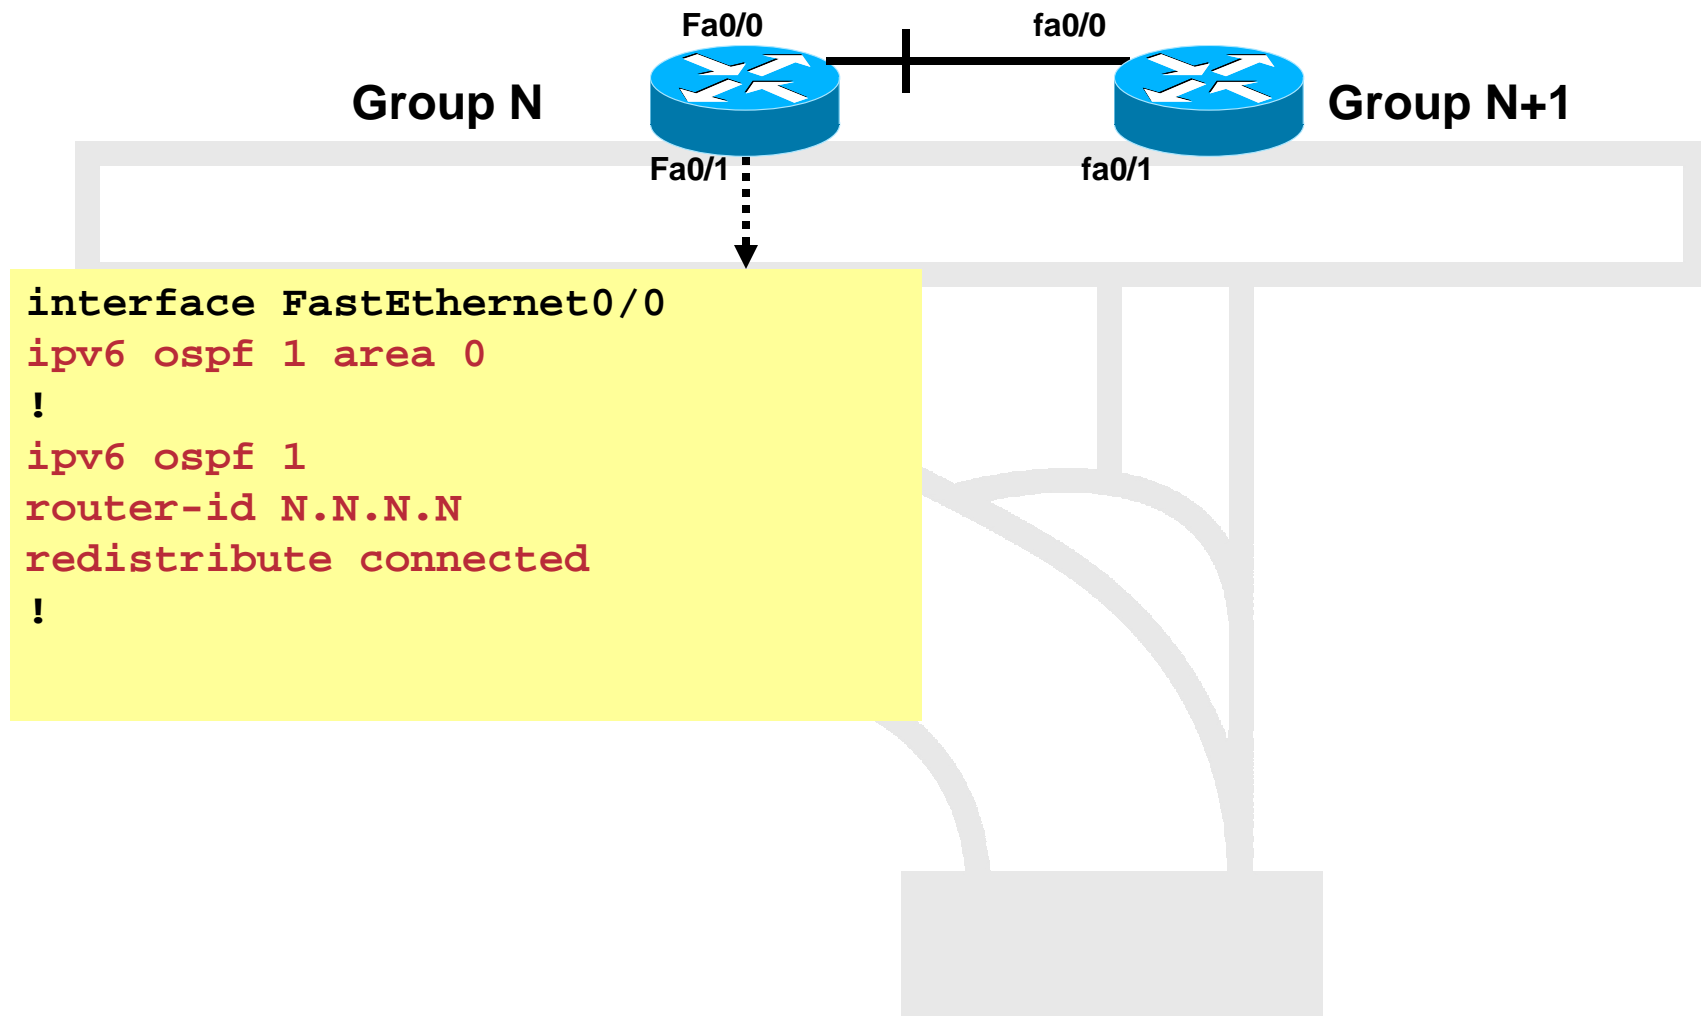

Cisco IOS OSPFv3 Display

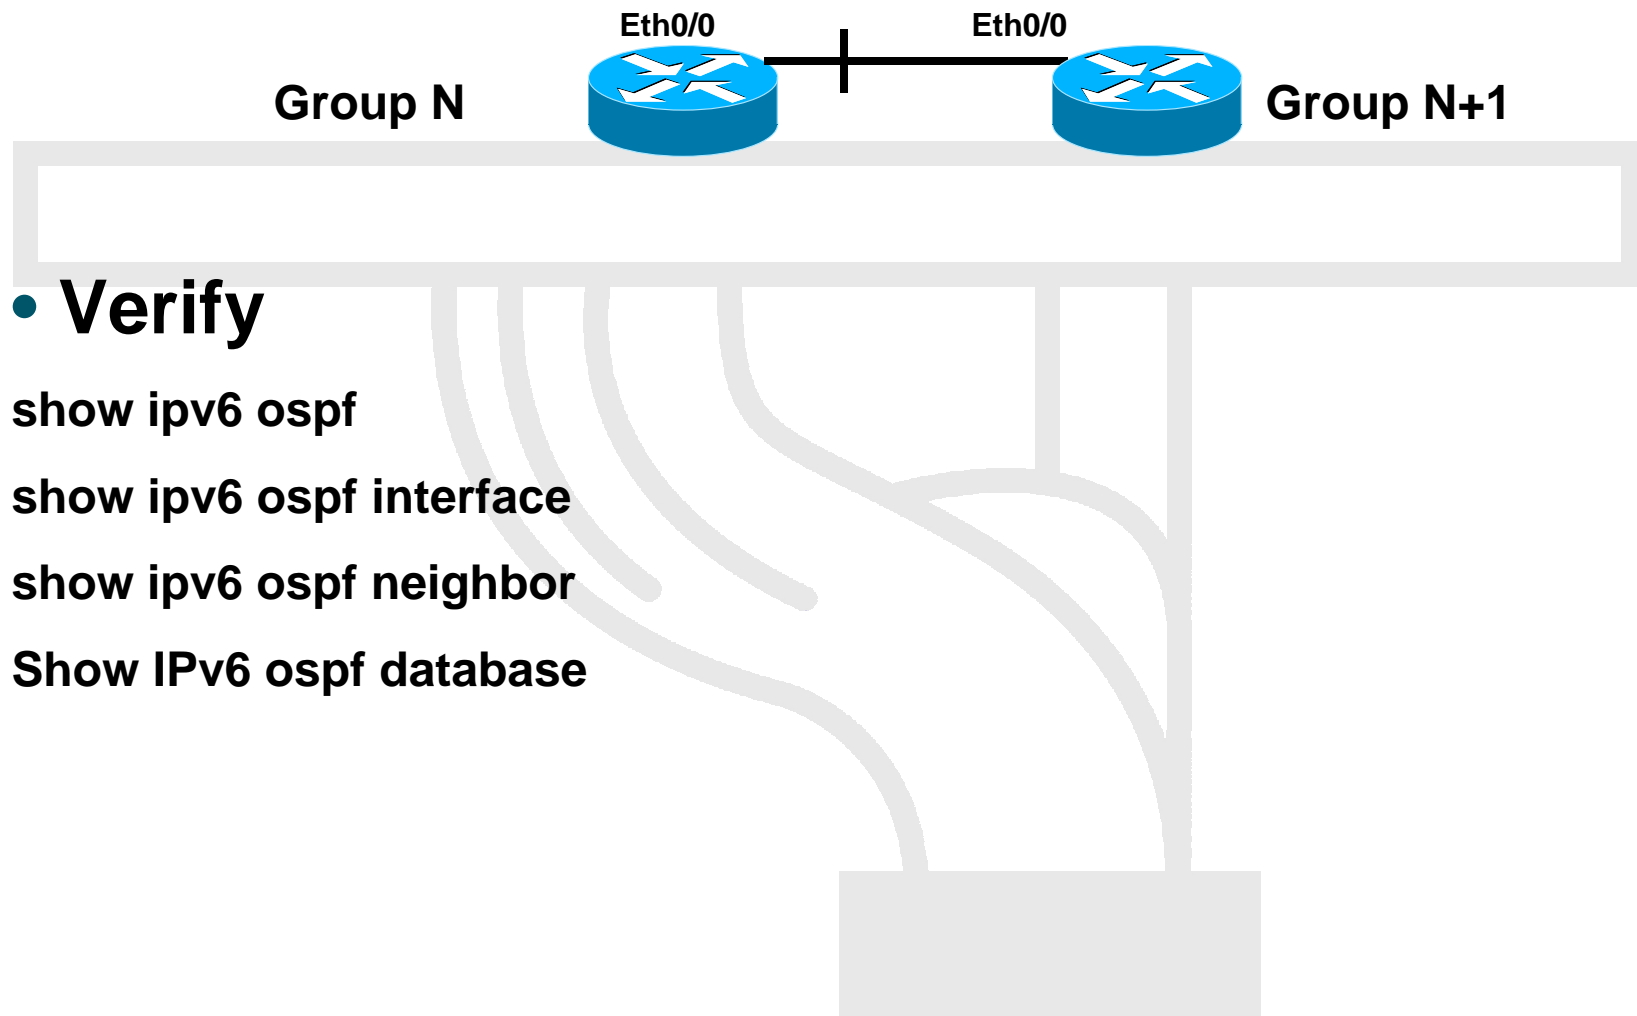

```
Router 2# show ipv6 route ospf
IPv6 Routing Table - 9 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
       U - Per-user Static route
       I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea
       O - OSPF intra, OI - OSPF inter, OE1 - OSPF ext 1, OE2 - OSPF ext 2
O   2001:1:1:2::1/128 [110/1]
    via FE80::205:5FFF:FEAF:2C38, Ethernet0
OI  2001:2:2::/48 [110/2]
    via FE80::205:5FFF:FEAF:2C38, Ethernet0
```

Enable OSPFv3

Verifying OSPFv3

- **Verify**

`show ipv6 ospf`

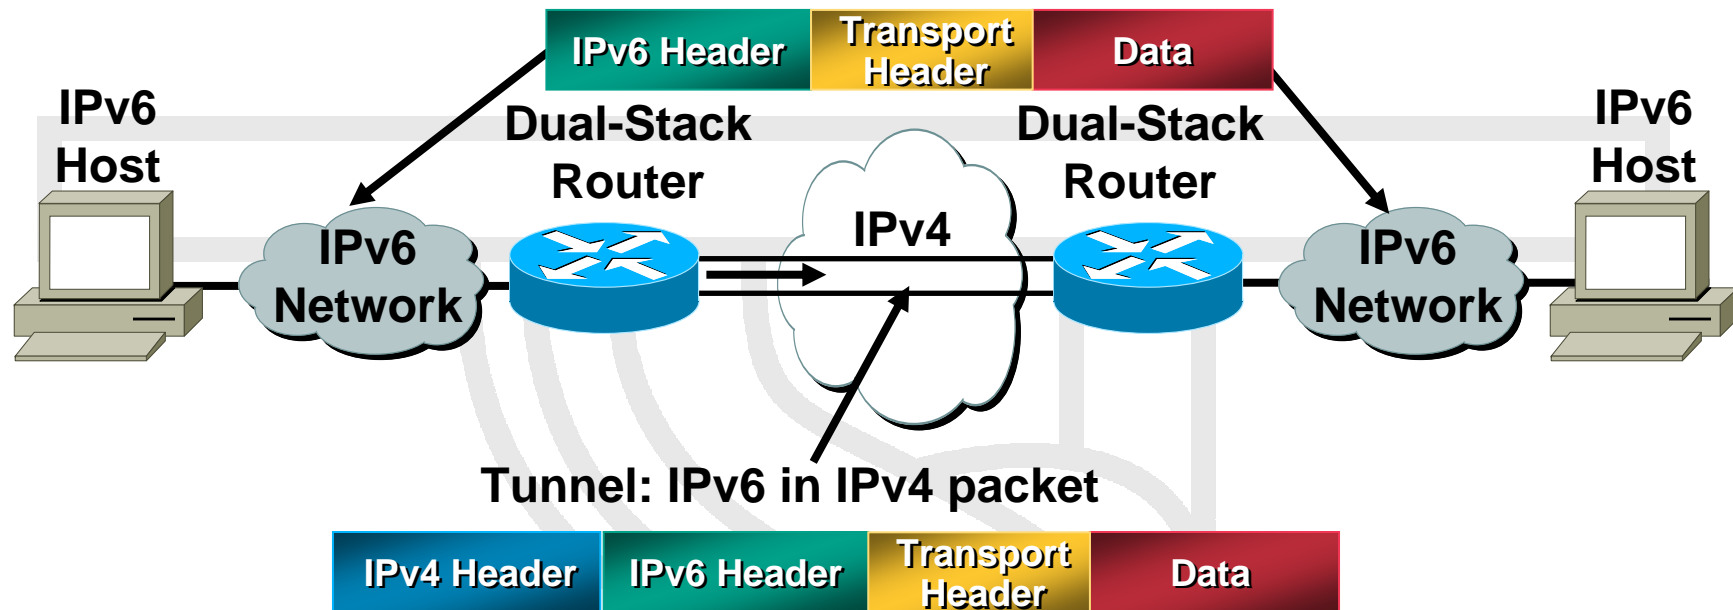

`show ipv6 ospf interface`

`show ipv6 ospf neighbor`

`Show IPv6 ospf database`

IPv6 over IPv4 Tunnels

- Tunneling is encapsulating the IPv6 packet in the IPv4 packet
- Tunneling can be used by routers and hosts
- Many techniques are available to establish a tunnel

Configured: Manual Tunnel (RFC 2893), GRE (RFC 2473)

Automatic: 6to4 (RFC 3056), ISATAP

Manually Configured Tunnel (RFC 2893)

```
router1#  
  
interface Tunnel0  
  ipv6 address 3ffe:b00:c18:1::3/64  
  tunnel source 192.168.99.1  
  tunnel destination 192.168.30.1  
  tunnel mode ipv6ip
```

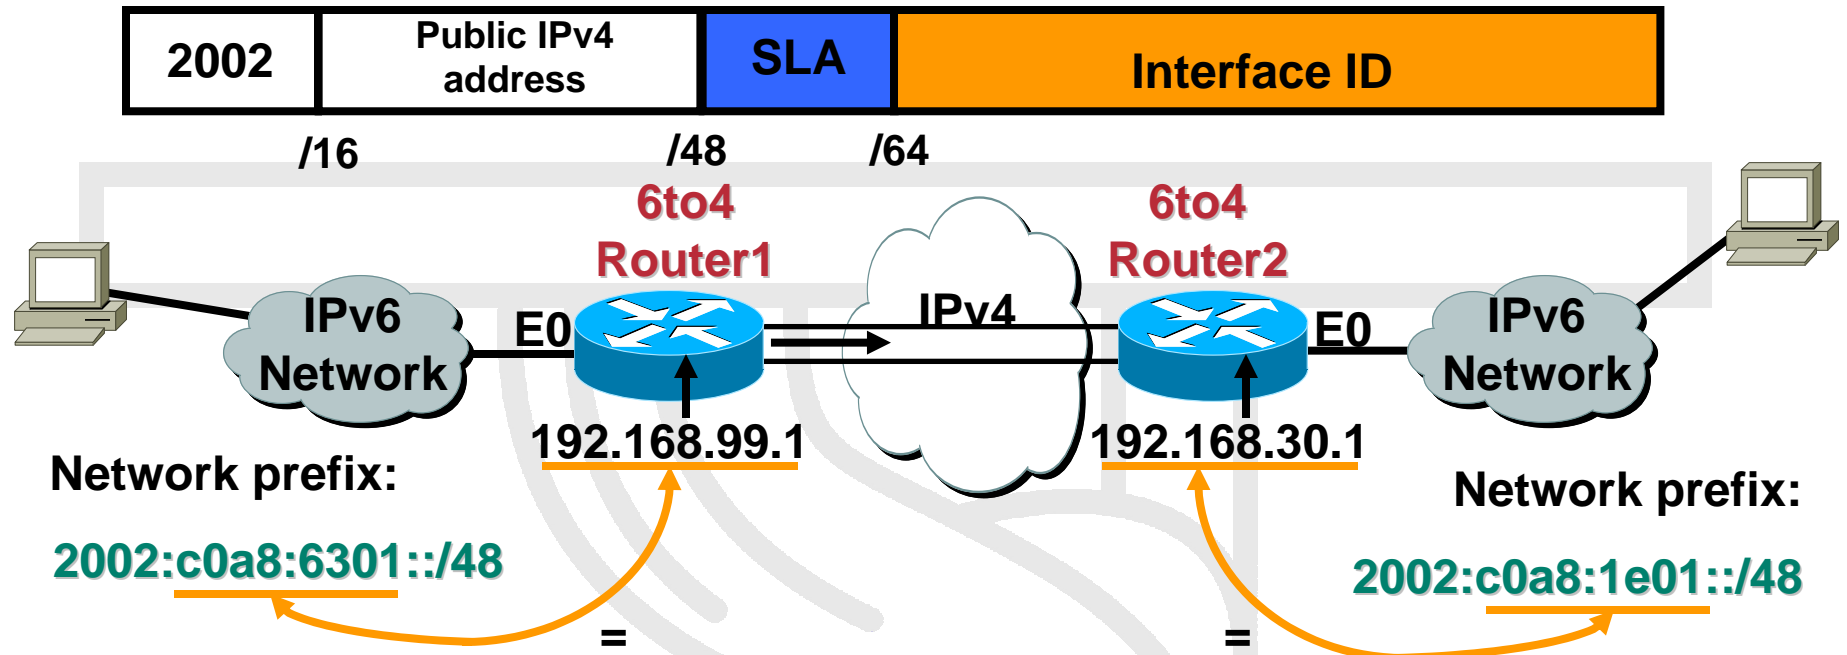

```
router2#  
  
interface Tunnel0  
  ipv6 address 3ffe:b00:c18:1::2/64  
  tunnel source 192.168.30.1  
  tunnel destination 192.168.99.1  
  tunnel mode ipv6ip
```

- **Manually Configured tunnels require:**

Dual stack end points

Both IPv4 and IPv6 addresses configured at each end

6to4 Tunnel (RFC 3056)

- **6to4 Tunnel:**

- Is an automatic tunnel method
- Gives a prefix to the attached IPv6 network
- 2002::/16 assigned to 6to4
- Requires one global IPv4 address

```

router2#
interface Loopback0
 ip address 192.168.30.1 255.255.255.0
 ipv6 address 2002:c0a8:1e01:1::/64 eui-64
interface Tunnel0
 no ip address
 ipv6 unnumbered Ethernet0
 tunnel source Loopback0
 tunnel mode ipv6ip 6to4

ipv6 route 2002::/16 Tunnel0
    
```

on each Ingress/Egress site

6to4 Relay

Network prefix:
2002:c0a8:6301::/48

IPv6 address:
2002:c0a8:1e01::1

```
router1#  
interface Loopback0  
 ip address 192.168.99.1 255.255.255.0  
 ipv6 address 2002:c0a8:6301:1::/64 eui-64  
interface Tunnel0  
 no ip address  
 ipv6 unnumbered Ethernet0  
 tunnel source Loopback0  
 tunnel mode ipv6ip 6to4  
  
ipv6 route 2002::/16 Tunnel0  
ipv6 route ::/0 2002:c0a8:1e01::1
```

- **6to4 relay:**

Is a gateway to the rest of the IPv6 Internet

Default router

Anycast address (RFC 3068) for multiple 6to4 Relay

Setup an IPv6/IPv4 tunnel

```
!  
interface Tunnel0  
ipv6 address 2001:4F8:FFFE:10F<N>::<N>/64  
tunnel source 196.200.209.N  
tunnel destination 196.200.209.<N+1>  
ipv6 rip AFRINIC enable  
tunnel mode ipv6ip  
!  
interface FastEthernet0/0  
ip address 196.200.209.N 255.255.255.0  
<remove IPV6 from the interface>  
!  
ipv6 router rip AFRINIC  
redistribute connected
```

Setup an IPv6/IPv4 tunnel - verifying

- **Verify**

- show ipv6 interface

- show ipv6 rip

- ping <remote loopback interface>

- **Suggestions**

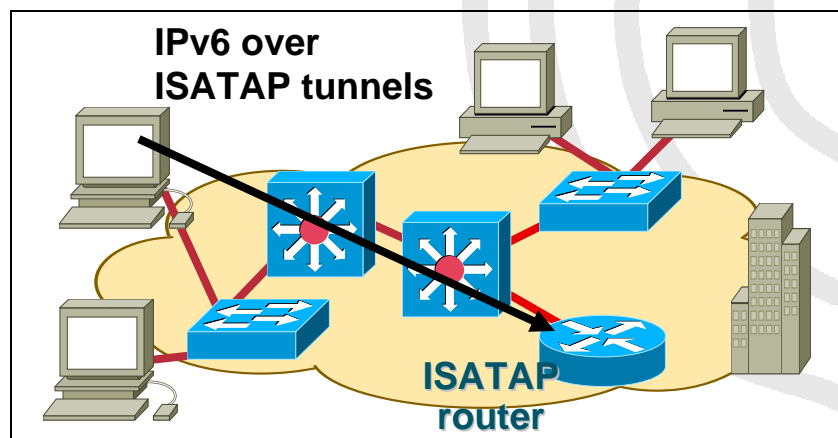

- Replace RIPng by static routing in the tunnel

- Monitor Router Advertisement in the tunnel

Campus Deployment: ISATAP

- An upgrade of Layer 3 infrastructure to implement Dual Stack can't be performed but IPv6 is needed

Supported on Microsoft Windows XP Pro SP1, .NET

Cost

Hardware/software dependencies

Sparse IPv6 population on campus

- ISATAP router provides an IPv6 prefix to the IPv6 hosts
- Direct connection via tunnels between ISATAP hosts
- ISATAP router used to go outside from the LAN

ISATAP Details

Use IANA's OUI 00-00-5E and encode IPv4 address as part of EUI-64

- **Automatic discovery of ISATAP routers**
 - DNS "isatap.domainname" A record lookup
 - Automatic deprecation when end system receives native IPv6 router advertisements

draft-ietf-ngtrans-isatap-11

draft-ietf-ngtrans-isatap-scenario-01

IPv6 Dissemination and Exploitation

ISATAP Router

Cisco IOS 12.2(15)T, 12.2(14)S

Supported in Windows XP Pro SP1

The tunnel source command must point to an interface with an IPv4 address configured.

Configure the ISATAP IPv6 address, and prefixes to be advertised just as you would with a native IPv6 interface.

The IPv6 address has to be configured as an EUI-64 address since the last 32 bits in the interface identifier is used as the IPv4 destination address.

```
ISATAP-gw#  
!  
interface Ethernet0  
 ip address 192.168.99.1 255.255.255.0  
!  
interface Tunnel0  
 ipv6 address 2001:0420:ACAC:3101::/64 eui-64  
 no ipv6 nd suppress-ra  
 tunnel source Ethernet0  
 tunnel mode ipv6ip isatap  
!
```

Windows XP Pro - ISATAP

- **Cisco Router**

IP (interface Fast0/0) : 10.151.1.1

ISATAP Default IPv6 : **FE80::5EFE:A97:101**

- **Windows XP Pro**

By default ISATAP Address = FE80::0000:5EFE:w.x.y.z

Where w.x.y.z is the IPv4 address

IP : 10.151.4.194

Default ISATAP IPv6 : **FE80::5EFE:10.151.4.194**

Adding global address - `ipv6 add 2/3000:1::10.151.1.194`

Adding route - `ipv6 rtu 3000:1::/64 2`

Cisco IOS

```
!  
interface Tunnel0  
  no ip address  
  no ip redirects  
  ipv6 address 3000:1::1/64  
  tunnel source FastEthernet0/0  
  tunnel mode ipv6ip isatap  
!  
interface FastEthernet0/0  
  ip address 10.151.1.1 255.255.255.0  
  speed 100  
  full-duplex  
  ipv6 address 2006:1::1/64  
  ipv6 nd prefix 2006:1::/64 10000 8000  
  ipv6 ospf 1 area 0  
!
```

Cisco IOS

```
r1#sh ipv6 int tu0
```

```
Tunnel0 is up, line protocol is up
```

```
IPv6 is enabled, link-local address is FE80::5EFE:A97:101
```

```
Global unicast address(es):
```

```
3000:1::1, subnet is 3000:1::/64
```

```
Joined group address(es):
```

```
FF02::1
```

```
FF02::2
```

```
FF02::1:FF00:0
```

```
FF02::1:FF00:1
```

```
FF02::1:FF97:101
```

```
MTU is 1480 bytes
```

```
ICMP error messages limited to one every 100 milliseconds
```

```
ICMP redirects are enabled
```

```
ND DAD is not supported
```

```
ND reachable time is 30000 milliseconds
```

```
Subnet-router Anycast is configured
```

```
Hosts use stateless autoconfig for addresses.
```

```
r1#
```

Windows XP

```
C:\>ipconfig
```

```
Configuration IP de Windows
```

```
Carte Ethernet Connexion au réseau local:

Windows XP Pro

Ping ISATAP address of R1
10.151.1.1

C:\>ping6 fe80::5efe:A97:101%2

Envoi d'une requête 'Ping' fe80::5efe:10.151.1.1%2

à partir de fe80::5efe:10.151.4.194%2 avec 32 octets de données :

Réponse de fe80::5efe:10.151.1.1%2 : octets = 32 temps=32 ms

Réponse de fe80::5efe:10.151.1.1%2 : octets = 32 temps=31 ms

Réponse de fe80::5efe:10.151.1.1%2 : octets = 32 temps=30 ms

Réponse de fe80::5efe:10.151.1.1%2 : octets = 32 temps=31 ms

Statistiques de Ping pour fe80::5efe:10.151.1.1%2 :

Paquets : envoyés = 4, reçus = 4, perdus = 0 (0% de perte),

Durée approximative des boucles en millisecondes :

Minimum = 30ms, maximum = 32ms, moyenne = 31ms

C:\>

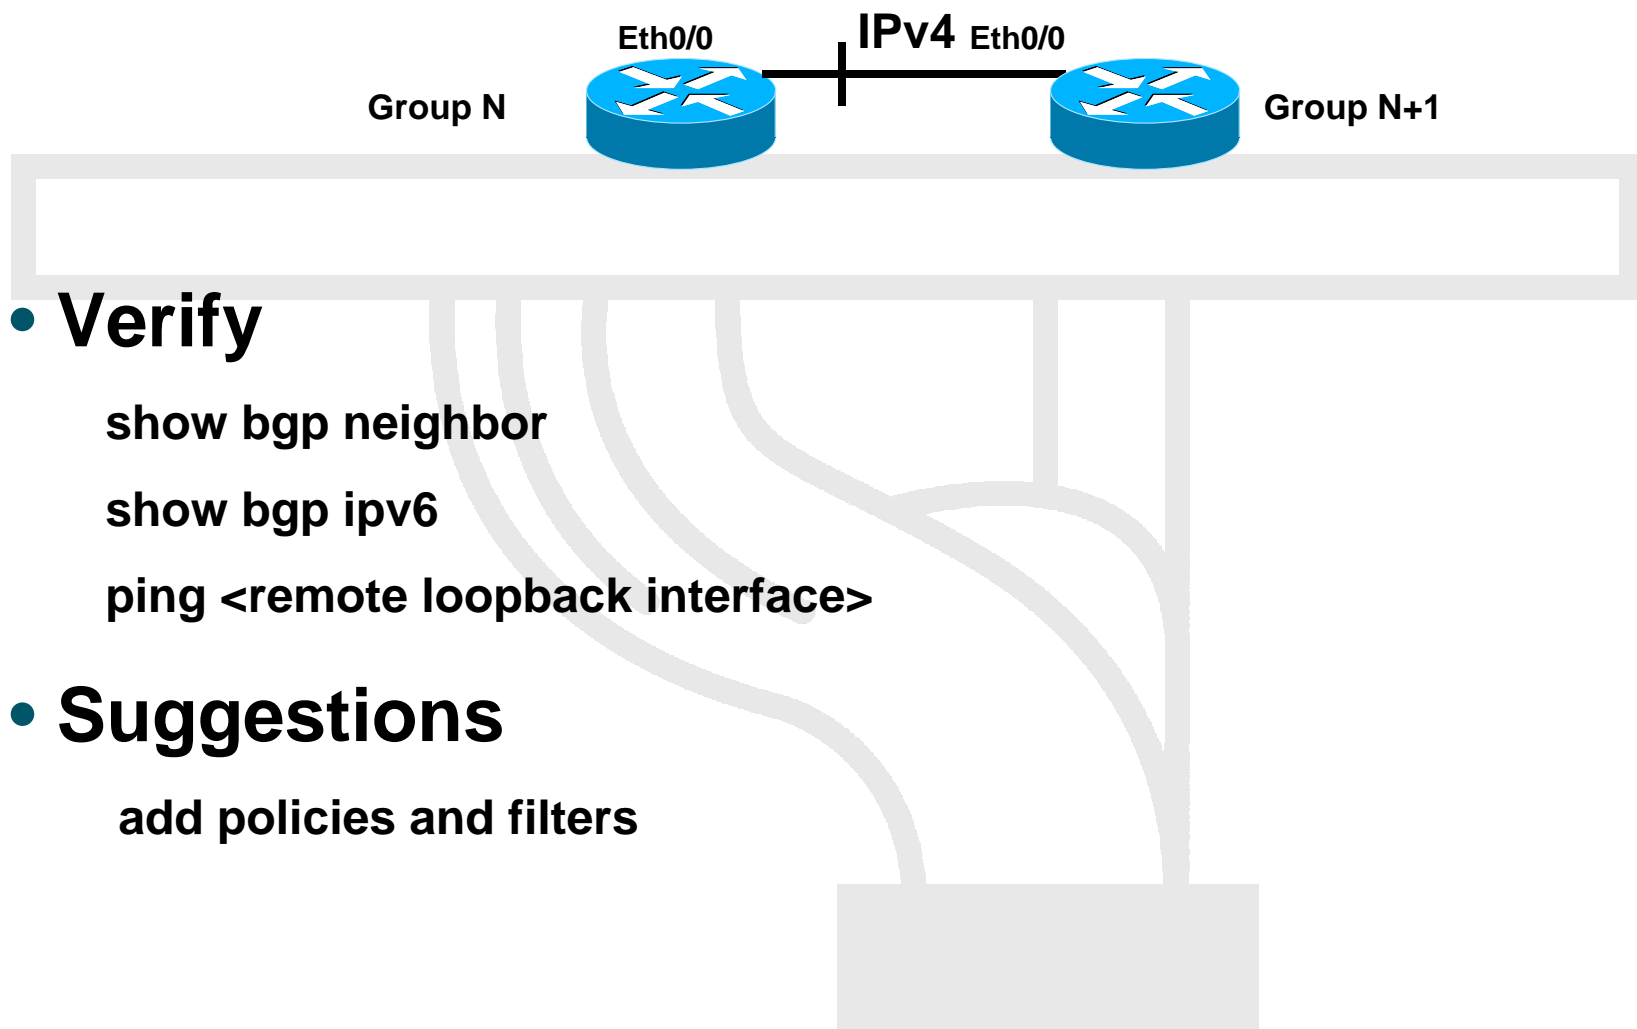

Enable MP-BGP on the tunnel

```
router bgp N
  no synchronization
  no bgp default ipv4-unicast
  bgp log-neighbor-changes
  neighbor 2001:4F8:FFFE:10F<N+1> remote-as <N+1>
  !
  address-family ipv6
  neighbor 2001:4F8:FFFE:10F<N+1> activate
  redistribute connected
  exit-address-family
  !
```

Enable MP-BGP on the tunnel- verifying

- **Verify**

- show bgp neighbor

- show bgp ipv6

- ping <remote loopback interface>

- **Suggestions**

- add policies and filters

MP-BGP peer over IPv6- verifying

- **Verify**

- show bgp neighbor

- Show bgp ipv6

- Ping <remote loopback interface>

- **Suggestions**

- Remove the “update-source” and see what happens

- Add policies and filters, play with attributes
